Question # 1 of 10

Information hiding can be achieved through_____.

- 1.Encapsulation, Inheritance
- 2.Encapsulation, Polymorphism
- 3.Encapsulation, Abstraction**
- 4.Overloading

Question # 2 of 10 (Start time: 01:11:21 AM) Total Marks: 1

A good model is related to a real life problem.

Select correct option:

- 1.Loosely
- 2.Openly
- 3.Closely**

Question # 3 of 10 (Start time: 01:12:33 AM) Total Marks: 1

Which of the following features of OOP is used to derive a class from another?

Select correct option:

- 1.Encapsulation
- 2.Polymorphism
- 3.Data hiding
- 4. Inheritance**

Question # 4 of 10 (Start time: 01:13:51 AM) Total Marks: 1

Which of the following is a weak relationship between two objects?

Select correct option:

1. Inheritance
- 2.Composition
- 3.Aggregation**
- 4.None of given

Question # 5 of 10 (Start time: 01:14:56 AM) Total Marks: 1

Data items in a class must be private.

Select correct option:

- 1.True
- 2.False**

Question # 6 of 10 (Start time: 01:15:52 AM) Total Marks: 1

Which one is a class association

Select correct option:

1.Simple Association

2. Inheritance

3.Composition

4.Aggregation

Question # 7 of 10 (Start time: 01:16:55 AM) Total Marks: 1

Suppose there is an object of type Person, which of the following can be considered as one of its attributes

Select correct option:

1.Name

2.Age

3.Work()

4.Both Name and Age

Question # 8 of 10 (Start time: 01:17:52 AM) Total Marks: 1

Which one is not an object association?

Select correct option:

1.Simple association

2. Inheritance

3.Aggregation

4.Association

Question # 9 of 10 (Start time: 01:18:50 AM) Total Marks: 1

Using encapsulation we can achieve

Select correct option:

1. Information hiding

2.Least interdependencies among modules

3. Implementation independence

4.All of given options

Question # 10 of 10 (Start time: 01:19:43 AM) Total Marks: 1

In constant member function the type of this pointer is:

Select correct option:

1.Constant pointer

2.Constant pointer to object

3.Constant pointer to class

4.Constant pointer to constant object

Question # 1 of 10

Which of the following is the way to extract common behavior and attributes from the given classes and make a separate class of those common behaviors and attributes?

1.Generalization

- 2.Sub-typing
- 3.Specialization
- 4.Extension

Question # 2 of 10

The ability to derive a class from more than one class is called

- 1.Single inheritance
- 2.Encapsulation
- 3.Multiple inheritance**
- 4.Polymorphism

Question # 3 of 10:

If MyClass has a destructor what is the destructor named?

- 1.MyClass
- 2.~MyClass**
- 3.My~Class
- 4.MyClass~

Question # 4 of 10:

Class abc{ ----- }; Is a valid class declaration?

- 1.yes**
- 2.no

Question # 5 of 10:

Without using Deep copy constructor, A _____ problem can occur

- 1.System crash
- 2.Memory Leakage
- 3.Dangling pointer
- 4.All of the given**

Question # 6 of 10:

If only one behaviour of a derived class is incompatible with base class, then it is:

- 1.Generalization
- 2.Specialization**
- 3.Extension
- 4. Inheritance

Question # 7 of 10:

Which of the following may not be an integral part of an object?

- 1. state
- 2.behavior
- 3.Protected data members
- 4.All of given**

Question # 8 of 10:

Only tangible things can be chosen as an object.

1.True

2.False

1.

2. Question # 1 of 10

Information hiding can be achieved through_____.

Encapsulation, Inheritance

Encapsulation, Polymorphism

Encapsulation, Abstraction

Overloading

Question # 2 of 10 (Start time: 01:11:21 AM) Total Marks: 1

A good model is related to a real life problem.

Select correct option:

Loosely

Openly

Closely

Question # 3 of 10 (Start time: 01:12:33 AM) Total Marks: 1

Which of the following features of OOP is used to derive a class from another?

Select correct option:

Encapsulation

Polymorphism

Data hiding

Inheritance

Question # 4 of 10 (Start time: 01:13:51 AM) Total Marks: 1

Which of the following is a weak relationship between two objects?

Select correct option:

Inheritance

Composition

Aggregation

None of given

Question # 5 of 10 (Start time: 01:14:56 AM) Total Marks: 1

Data items in a class must be private.

Select correct option:

True

False

Question # 6 of 10 (Start time: 01:15:52 AM) Total Marks: 1

Which one is a class association

Select correct option:

Simple Association

Inheritance

Composition

Aggregation

Question # 7 of 10 (Start time: 01:16:55 AM) Total Marks: 1

Suppose there is an object of type Person, which of the following can be considered as

one of its attributes

Select correct option:

Name

Age

Work()

Both Name and Age

Question # 8 of 10 (Start time: 01:17:52 AM) Total Marks: 1

Which one is not an object association?

Select correct option:

Simple association

Inheritance

Aggregation

Association

Question # 9 of 10 (Start time: 01:18:50 AM) Total Marks: 1

Using encapsulation we can achieve

Select correct option:

Information hiding

Least interdependencies among modules

Implementation independence

All of given options

Question # 10 of 10 (Start time: 01:19:43 AM) Total Marks: 1

In constant member function the type of this pointer is:

Select correct option:

Constant pointer

Constant pointer to object

Constant pointer to class

Constant pointer to constant object

Question # 1 of 10

Which of the following is the way to extract common behavior and attributes from the

given classes and make a separate class of those common behaviors and attributes?

Generalization

Sub-typing

Specialization

Extension

Question # 2 of 10

The ability to derive a class from more than one class is called
Single inheritance

Encapsulation

Multiple inheritance

Polymorphism

Question # 3 of 10:

If MyClass has a destructor what is the destructor named?

MyClass

~MyClass

My~Class

MyClass~

Question # 4 of 10:

Class abc{ ----- }; Is a valid class declaration?

yes

no

Question # 5 of 10:

Without using Deep copy constructor, A _____ problem can occur

System crash

Memory Leakage

Dangling pointer

All of the given

Question # 6 of 10:

If only one behaviour of a derived class is incompatible with base class, then it is:

Generalization

Specialization

Extension

Inheritance

Question # 7 of 10:

Which of the following may not be an integral part of an object?

state

behavior

Protected data members

All of given

Question # 8 of 10:

Only tangible things can be chosen as an object.

True

False

Class is not a mechanism to create objects and define user data types.

1. true

2. false

Memory is allocated to non static members only, when:

1. Class is created
2. Object is defined
3. Object is initialized
4. Object is created

The sub-object's life is not dependent on the life of master class in _____.

1. Composition
2. Aggregation
3. Separation
4. non of the given

Unary operators and assignment operator are right associative.

1. true
2. false

The >= operator can't be overloaded.

1. true
2. false

_____ is creating objects of one class inside another class.

1. Association
2. Composition
3. Aggregation
4. Inheritance

If we are create array of objects through new operator, then

1. We can call overloaded constructor through new
2. We can't call overloaded constructor through new
3. We can call default constructor through new
4. None of the given

Object can be declared constant with the use of Constant keyword.

1. true
2. false

_____ Operator will take only one operand.

1. New
2. int
3. object
4. none of the given

Which of the following operator(s) take(s) one or no argument if overloaded?

1. ++
2. *
3. %
4. All of the given choices

this pointer does not pass implicitly to _____ functions.

1. Static Member
2. Non-Static Member
3. Instance Number
4. None of the given

Operator overloading is

1. making C++ operators work with objects.
2. giving C++ operators more than they can handle.
3. giving new meanings to existing Class members.
4. making new C++ operators

MC100202262 : Muhammad Naveed Anjum

Quiz Start Time: 09:57 AM

FINAL TERM EXAMINATION

Spring 2010

CS304- Object Oriented Programming (Session - 4)

Question No: 1 (Marks: 1) - Please choose one

Classes like TwoDimensionalShape and ThreeDimensionalShape would normally be

concrete, while classes like Sphere and Cube would normally be abstract.

True

False

Question No: 2 (Marks: 1) - Please choose one

Virtual functions allow you to

create an array of type pointer-to-base class that can hold pointers to derived classes.

create functions that can never be accessed.

group objects of different classes so they can all be accessed by the same function

code.

use the same function call to execute member functions of objects from different classes

Question No: 3 (Marks: 1) - Please choose one

A pointer to a base class can point to objects of a derived class.

True

False

Question No: 4 (Marks: 1) - Please choose one

A copy constructor is invoked when

a function do not returns by value.

an argument is passed by value.

a function returns by reference.

an argument is passed by reference.

Question No: 5 (Marks: 1) - Please choose one

Each try block can have _____ no. of catch blocks.

1

2

3

As many as necessary.

Question No: 6 (Marks: 1) - Please choose one

Non Template Friend functions of a class are friends of _____instance/s of that class.

- All
- One specific
- All instances of one date type
- None of the given options

Question No: 7 (Marks: 1) - Please choose one

Template functions use _____ than ordinary functions.

- Greater Memory
- Lesser Memory
- Equal Memory
- None of the given options

Question No: 8 (Marks: 1) - Please choose one

The find() algorithm

- finds matching sequences of elements in two containers.
- finds a container that matches a specified container.
- takes iterators as its first two arguments.
- takes container elements as its first two arguments.

Question No: 9 (Marks: 1) - Please choose one

The copy() algorithm returns an iterator to

—

—

- the last element copied from.
- the last element copied to.
- the element one past the last element copied from.
- the element one past the last element copied to.

Question No: 10 (Marks: 1) - Please choose one

If you define a vector v with the default constructor, and define another vector w with a

one-argument constructor to a size of 11, and insert 3 elements into each of these vectors

with push_back(), then the size() member function will return _____ for v and _____ for

w.

- 11 for v and 3 for w.
- 0 for v and 0 for w.
- 0 for v and 3 for w.
- 3 for v and 11 for w.

Question No: 11 (Marks: 1) - Please choose one
Which is not the Advantage of inheritance?

- _ providing class growth through natural selection.
- _ facilitating class libraries.
- _ avoiding the rewriting of code.
- _ providing a useful conceptual framework.

Question No: 12 (Marks: 1) - Please choose one
class DocElement

```
{
public:
virtual void Print() { cout << "Generic element"; }
};
class Heading : public DocElement
{
public:
void Print() { cout << "Heading element"; }
};
```

–

```
–
class Paragraph : public DocElement
{
public:
void Print() { cout << "Paragraph element"; }
};
void main()
{
DocElement * p = new Paragraph();
p->Print();
}
```

When you run this program, it will print out a single line to the console output.
What will be in that line?

Select one correct answer from the following list:

- _ Generic element
- _ Heading element
- _ Paragraph element
- _ Nothing will be printed.

Question No: 13 (Marks: 1) - Please choose one

Which type of inheritance is being represented by the following statement,

```
class X : public A, public B { ... ... };
```

- _ Single inheritance
- _ Multiple inheritance
- _ Double inheritance
- _ None of the given options

Question No: 14 (Marks: 1) - Please choose one

When we write a class template the first line must be:

—

—

- _ `template < class class_name >`
- _ `template < class data_type >`
- _ `template < class T >`

Here T can be replaced with any name but it is preferable.

_ `class class-name()`

`class template<class_name>`

Question No: 15 (Marks: 1) - Please choose one

Function templates should be used where code and behavior must be identical.

- _ True
- _ False

Question No: 16 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

- _ Reusability
- _ Writability
- _ Maintainability
- _ All of given

Question No: 17 (Marks: 1) - Please choose one

The specialization pattern `<T*>` after the name says that this specialization is to be used

for every,

- _ data type
- _ meta type
- _ virtual type

—

—

_ pointer type

Question No: 18 (Marks: 1) - Please choose one

A range is often supplied to an algorithm by two _____ values.

- italic
- iteration
- iterator
- None of given

Question No: 19 (Marks: 1) - Please choose one

Which of the following is an integral part of an object?

- State
- Behavior
- Unique identity
- All of the given

Question No: 20 (Marks: 1) - Please choose one

Consider the following statement

Cupboard has books

What is the relationship between Cupboard and books?

- Composition
- Aggregation
- Inheritance
- None of the given options

Question No: 21 (Marks: 1) - Please choose one

Which sentence clearly defines an object?

—

—

- one instance of a class.
- another word for a class.
- a class with static methods.
- a method that accesses class attributes.

Question No: 22 (Marks: 1) - Please choose one

_____, which means if A declares B as its friend it does NOT mean that A can

access private data of B. It only means that B can access all data of A.

- Friendship is one way only
- Friendship is two way only
- NO Friendship between classes
- Any kind of friendship

Question No: 23 (Marks: 1) - Please choose one

The statement `objA=objB;` will cause a compiler error if the objects are of different classes.

True

False

Question No: 24 (Marks: 1) - Please choose one

Consider the call given below of an overloaded operator "+",

Rational_number_1 + Rational_number_2

Where Rational_number_1 and Rational_number_2 are the two objects of Rational_number class (a user defined class). Identify which of the above two objects

will be passed as an argument to the overloaded operator function?

—

—

Rational_number_1

Rational_number_2

Both Rational_number_1 & Rational_number_2

any of the two objects, randomly

Question No: 25 (Marks: 1) - Please choose one

If a class D has been derived using protected inheritance from class B (If B is a protected

base and D is derived class) then public and protected members of B -----
accessed by

member functions and friends of class D and classes derived from D

can be

cannot be

does restrict to be

not given

Question No: 26 (Marks: 1) - Please choose one

In Private ----- only member functions and friend classes or functions of a derived class can convert pointer or reference of derived object to that of parent object

specialization

inheritance

abstraction

composition

Question No: 27 (Marks: 2)

Give two uses of a destructor.

Question No: 28 (Marks: 2)

Describe the way to declare a template class as a friend class of any other class.

Question No: 29 (Marks: 2)

Give the name of two basic types of containers collectively called First class containers?

Question No: 30 (Marks: 2)

State any conflict that may rise due to multiple inheritance?

Question No: 31 (Marks: 3)

What will be the output after executing the following code?

```
class c1{
public:
virtual void function(){
cout<<"I am in c1"<<endl;
```

–

–

```
}
};
class c2: public c1{
public:
void function(){
cout<<"I am in c2"<<endl;
}
};
class c3: public c1 {
public:
void function(){
cout<<"I am in c3"<<endl;
}
};
int main(){
c1 * test1 = new c2();
c1 * test2 = new c3();
test1->function();
test2->function();
system("PAUSE");
return 0;
}
```

Question No: 32 (Marks: 3)

If we declare a function as friend of a template class will it be a friend for a particular data type or for all data types of that class.

Question No: 33 (Marks: 3)

Tell the logical error/s in the code given below with reference to resource management;

also describe how we can correct that error/s.

```
class Test{
public:
int function1(){
try{
```

–

–

```
FILE *fileptr = fopen(“filename.txt”,“w”);
throw exception();
fclose(fileptr);
return 0;
}
catch(Exception e){
...
}
}
};
```

Question No: 34 (Marks: 5)

What is the output produced by the following program?

```
#include<iostream.h>
void sample_function(double test) throw (int);
int main()
{
try
{
cout <<”Trying.\n”;
sample_function(98.6);
cout << “Trying after call.\n”;
}
catch(int)
{
cout << “Catching.\n”;
}
cout << “End program.\n”;
return 0;
```

```

}
void sample_function(double test) throw (int)
{
cout << "Starting sample_function.\n";
if(test < 100)
throw 42;
}

```

Question No: 35 (Marks: 5)

The code given below has one template function as a friend of a template class,

1. You have to identify any error/s in this code and describe the reason for error/s.
2. Give the correct code after removing the error/s.

—

—

```

template<typename U>
void Test(U);
template< class T >
class B {
int data;
public:
friend void Test<>( T );
};
template<typename U>
void Test(U u){
B < int> b1;
b1.data = 7;
}
int main(int argc, char *argv[])
{
char i;
Test(i);
system("PAUSE");
return 0;
}

```

Question No: 36 (Marks: 5)

Consider the following class,

```

class Base
{
char * p;

```

```

public:
Base() { p = new char[10]; }
~Base() { delete [] p; }
};
class Derived : public Base
{
char * q;
public:
Derived() { q = new char[20]; }
~Derived() { delete [] q; }
};
void foo()
{
Base* p = new Derived();

```

–

```

–
delete p;
}

```

With this program, every time function foo is called, some memory will leak. Explain why memory will leak. Also, explain how to fix this problem.

FINAL TERM EXAMINATION

Fall 2009

CS304- Object Oriented Programming (Session - 1)

Time: 120 min

Marks: 75

Question No: 1 (Marks: 1) - Please choose one

Which one of the following terms must relate to polymorphism?

- Static allocation
- Static typing
- [Dynamic binding](#)
- Dynamic allocation

Question No: 2 (Marks: 1) - Please choose one

Multiple inheritance can be of type

- Public
- Private

–

Protected

All of the given

Question No: 3 (Marks: 1) - Please choose one

When a subclass specifies an alternative definition for an attribute or method of its superclass, it is _____ the definition in the superclass.

overload

overriding

copy riding

none of given

Question No: 4 (Marks: 1) - Please choose one

Like template functions, a class template may not handle all the types successfully.

True

False

Question No: 5 (Marks: 1) - Please choose one

It is sometimes useful to specify a class from which no objects will ever be created.

True

False

Question No: 6 (Marks: 1) - Please choose one

Assume a class Derv that is privately derived from class Base. An object of class Derv

located in main() can access

public members of Derv.

protected members of Derv.

—

—

private members of Derv.

protected members of Base.

Question No: 7 (Marks: 1) - Please choose one

A pointer to a base class can point to objects of a derived class.

True

False

Question No: 8 (Marks: 1) - Please choose one

A copy constructor is invoked when

a function do not returns by value.

an argument is passed by value.

a function returns by reference.

an argument is passed by reference.

Question No: 9 (Marks: 1) - Please choose one

A function call is resolved at run-time in _____

- non-virtual member function.
- virtual member function.
- Both non-virtual member and virtual member function.
- None of given

Question No: 10 (Marks: 1) - Please choose one

When the base class and the derived class have a member function with the same name,

you must be more specific which function you want to call (using _____).

—

—

- scope resolution operator
- dot operator
- null operator
- Operator overloading

Question No: 11 (Marks: 1) - Please choose one

Each try block can have _____ no. of catch blocks.

- 1
- 2
- 3
- As many as necessary.

Question No: 12 (Marks: 1) - Please choose one

Two important STL associative containers are _____ and _____.

- set,map
- sequence,mapping
- setmet,multipule
- sit,mat

Question No: 13 (Marks: 1) - Please choose one

The mechanism of selecting function at run time according to the nature of calling object

is called,

- late binding
- static binding
- virtual binding
- None of the given options

Question No: 14 (Marks: 1) - Please choose one

An abstract class is useful when,

–

- We do not derive any class from it.
- There are multiple paths from one derived class to another.
- **We do not want to instantiate its object.**
- You want to defer the declaration of the class.

Question No: 15 (Marks: 1) - Please choose one

Which of the following is incorrect line regarding function template?

- `template<class T>`
- `template <typename U>`
- **`Class<template T>`**
- `template < class T, class U>`

Question No: 16 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

- Reusability
- Writability
- Maintainability
- **All of given**

Question No: 17 (Marks: 1) - Please choose one

By default the vector data items are initialized to _____

- **0**
- 0.0
- 1
- null

–

–
Question No: 18 (Marks: 1) - Please choose one

Which one of the following functions returns the total number of elements in a vector.

- `length();`
- **`size();`**
- `ele();`
- `veclen();`

Question No: 19 (Marks: 1) - Please choose one

Suppose you create an uninitialized vector as follows:

`vector<int> evec;`

After adding the statement,
evec.push_back(21);
what will happen?

- _ The following statement will add an element to the start (the back) of evec and will initialize it with the value 21.
- _ The following statement will add an element to the center of evec and will reinitialize it with the value 21.
- _ The following statement will delete an element to the end (the back) of evec and will reinitialize it with the value 21.
- _ **The following statement will add an element to the end (the back) of evec and initialize it with the value 21.**

Question No: 20 (Marks: 1) - Please choose one

An STL container can not be used to,

- _ hold objects of class employee.
- _ store elements in a way that makes them quickly accessible.
- _ **compile c++ programs.**
- _ organize the way objects are stored in memory

Question No: 21 (Marks: 1) - Please choose one

Algorithms can only be implemented using STL containers.

- _ True
- _ **False**

Question No: 22 (Marks: 1) - Please choose one

The main function of scope resolution operator (::) is,

—

—

- _ **To define an object**
- _ To define a data member
- _ To link the definition of an identifier to its declaration
- _ To make a class private

Question No: 23 (Marks: 1) - Please choose one

When is a constructor called?

- _ Each time the constructor identifier is used in a program statement
- _ **During the instantiation of a new object**
- _ During the construction of a new class
- _ At the beginning of any program execution

Question No: 24 (Marks: 1) - Please choose one

Consider the code below,

```
class Fred {
```

```

public:
Fred();
...
};
int main()
{
Fred a[10];
Fred* p = new Fred[10];
...
}

```

Select the best option,

- Fred a[10]; calls the default constructor 09 times
- Fred* p = new Fred[10]; calls the default constructor 10 times
- Produce an error
- Fred a[10]; calls the default constructor 11 times
- Fred* p = new Fred[10]; calls the default constructor 11 times
- Fred a[10]; calls the default constructor 10 times
- Fred* p = new Fred[10]; calls the default constructor 10 times

–

Question No: 25 (Marks: 1) - Please choose one
 Associativity can be changed in operator overloading.

- True
- False

Question No: 26 (Marks: 1) - Please choose one

A normal C++ operator that acts in special ways on newly defined data types is said to

be

- glorified.
- encapsulated.
- classified.
- overloaded.

Question No: 27 (Marks: 1) - Please choose one

Which operator can not be overloaded?

- The relation operator (>=)
- Assignment operator (=)
- Script operator ([])
- Conditional operator (? :)

Question No: 28 (Marks: 1) - Please choose one

Suppose obj1 and obj2 are two objects of a user defined class A. An + operator is overloaded to add obj1 and obj2 using the function call obj1+obj2.

Identify the correct function prototype against the given call?

–

–

– A operator + (A &obj);

– int + operator();

– [int operator \(plus\) \(\);](#)

– A operator(A &obj3);

Question No: 29 (Marks: 1) - Please choose one

Default constructor is such constructor which either has no -----or if it has some parameters these have ----- values

– Parameter, temporary

– Null, Parameter

– [Parameter, default](#)

– non of the given

Question No: 30 (Marks: 1) - Please choose one

Public methods of base class can ----- be accessed in its derived class

– directly

– [indirectly](#)

– simultaneously

– non of the given

Question No: 31 (Marks: 1)

Is Deque a Birectional Container?

[Yes, deque behaves like queue \(line\) such that we can add elements on both sides of it.](#)

Question No: 32 (Marks: 1)

What is meant by Generic Programming?

[Generic programming refers to programs containing generic abstractions general code](#)

[that is same in logic for all data types like printArray function\), then we instantiate that](#)

[generic program abstraction \(function, class\) for a particular data type, such abstractions](#)

[can work with many different types of data.](#)

Question No: 33 (Marks: 2)

Sort the following data in the order in which compiler searches a function?

Complete Specialization, Generic Template, Partial Specialization, Ordinary Function.

Specializations of this function template, instantiations with specific types, can be called

just like an ordinary function:

```
cout << max(3, 7); // outputs 7
```

–

–

The compiler examines the arguments used to call max and determines that this is a call

to max(int, int). It then instantiates a version of the function where the parameterizing

type T is int, making the equivalent of the following function:

```
int max(int x, int y)
```

```
{
```

```
return x < y ? y : x;
```

```
}
```

the C++ Standard Template Library contains the function template max(x, y) which

creates functions that return either x or y, whichever is larger. max() could be defined like

this:

```
template <typename T>
```

```
T max(T x, T y)
```

```
{
```

```
return x < y ? y : x;
```

```
}
```

Question No: 34 (Marks: 2)

State any conflict that may rise due to multiple inheritance?

The conflict may arise is the diamond problem, which our author likes to call the “diamond of doom”. This occurs when a class multiply inherits from two classes which

each inherit from a single base class. This leads to a diamond shaped inheritance pattern.

For example, consider the following set of classes:

```
class PoweredDevice
```

```
{
```

```
};
```

```
classScanner: publicPoweredDevice
{
};
classPrinter: publicPoweredDevice
{
};
classCopier: publicScanner, publicPrinter
{
};
```

—

—
Scanners and printers are both powered devices, so they derived from PoweredDevice.

However, a copy machine incorporates the functionality of both Scanners and Printers.

Ambiguity also cause problem.

Question No: 35 (Marks: 3)

Describe three properties necessary for a container to implement Generic Algorithms.

If you declare a container as holding pointers, you are responsible for managing the

memory for the objects pointed to. The container classes will not automatically free

memory for these objects when an item is erased from the container.

Container classes are expected to implement methods to do the following:

- create a new empty container (constructor),
- report the number of objects it stores (size),
- delete all the objects in the container (clear),
- insert new objects into the container,
- remove objects from it,
- provide access to the stored objects.

Question No: 36 (Marks: 3)

Write three important features of virtual functions.

With virtual functions, derived classes can provide new implementations of functions

from their base classes. When someone calls a virtual function of an object of the derived

class, this new implementation is called, even if the caller uses a pointer to the base class,

and doesn't even know about the particular derived class.

The virtual function is an option, and the language defaults to non virtual, which is the

fastest configuration.

The derived class can completely "override" the implementation or "augment" it (by

explicitly calling the base class implementation in addition to the new things it does).

—

—

Question No: 37 (Marks: 3)

Consider the code below,

```
#include <iostream>
#include <stdlib.h>
using namespace std;
class Shape{
public:
void Draw(){cout<<"shape"<<endl;}
};
class Line : public Shape{
public:
void Draw(){cout<<"Line"<<endl;}
};
class Circle : public Shape{
public:
void Draw(){cout<<"Circle"<<endl;}
};
int main(int argc, char *argv[])
{
Shape * ptr1 = new Shape();
Shape * ptr2 = new Line();
Shape * ptr3 = new Circle();
ptr1->Draw();
ptr2->Draw();
ptr3->Draw();
system("PAUSE");
```

```
return 0;
}
```

This code shows output,

Shape

Shape

Shape

Give the reason for this output

Suppose we want to show the output,

Shape

Line

Circle

—

—

How we can change the code to do that?

```
class shape { public:
void draw();
};
class circle : public shape { };
int main(int argc, char **argv){
circle my_circle;
my_circle.draw();
}
```

While this has all the usual advantages, e.g., code reuse, the real power of polymorphism

comes into play when draw is declared to be virtual or pure virtual, as follows:

```
class shape{ public:
virtual void draw()=0;
};
class circle : public shape { public:
void draw();
}
```

Here, circle has declared its own draw function, which can define behavior appropriate

for a circle. Similarly, we could define other classes derived from shape, which provide

their own versions of draw. Now, because all the classes implement the shape interface,

we can create collections of objects that can provide different behavior invoked in a consistent manner (calling the draw member function). An example of this is shown here.

```
shape *shape_list[3]; // the array that will
// pointer to our shape objects
shape[0] = new shape; // three types of shapes
shape[1] = new line; // we have defined
shape[2] = new circle;
for(int i = 0; i < 3; i++){
shape_list[i].draw();
}
```

When we invoke the draw function for each object on the list, we do not need to know anything about each object; C++ handles the details of invoking the correct version of draw. This is a very powerful technique, allowing us to provide extensibility in our designs. Now we can add new classes derived from shape to provide whatever behavior we desire. The key here is that we have separated the interface (the prototype for shape) from the implementation.

Question No: 38 (Marks: 5)

There are some errors in the code given below, you have to

1. Indicate the line no. with error/s
2. Give the reason for error/s
3. Correct the error/s.

—

—

1. #include <iostream> this will be #include <iostream.h>
2. #include <stdlib.h>
3. using namespace std;
4. template <typename T>
5. class MyClass{
6. public:
7. MyClass(){
8. cout<<"This is class1"<<endl;
9. }

```

10. };
11. template <typename T>
12. class MyClass<int*>{
13. public:
14. MyClass(){
15. cout<<"This is class2"<<endl;
16. }
17. };
18. int main(int argc, char *argv[])
19. {
20. MyClass<int> c1;
21. MyClass<int*> c2;
22. system("PAUSE");
23. return 0;
24. }

```

Question No: 39 (Marks: 5)

Given are two classes A and B. class B is inherited from class A. Write a code snippet(for main function) that polymorphically call the method of class B. Also what

changes do you suggest in the given code segment that are required to call the class B

method polymorphically.

```

class A
{
public:
void method() { cout<<"A's method \n"; }
};
class B : public A
{
public:
void method() { cout<<"B's method\n"; }

```

–

–

```
};
```

Ans:

```

public class Test
{
public class A {}

```

```

public class B extends A { }
private void test(A a)
{
System.out.println("test(A)");
}
private void test(B b)
{
System.out.println("test(B)");
}
public static void main(String[] args)
{
Test t = new Test();
A a = t.new A();
A b = t.new B();
t.test(a);
t.test(b);
}
}

```

Question No: 40 (Marks: 10)

Create built-in STL (Standard Template Library) vector class object for strings and add in it some words by taking input from user, then apply the sort() algorithm to array of words stored in this vector class object.

Hint: Use push_back() to add the words in vector class object, and the [] operator and size() to display these sorted words.

The STL is the containers, iterators and algorithms component of the proposed C++

Standard Library [ANSI95]. It represents a novel application of principles which have

their roots in styles of programming other than Object-orientation.

```
void listWords(istream& in, ostream& out)
```

—

—

```

{
string s;
while (!in.eof() && in >> s) {
add s to some container
}
sort the strings in the container

```

```

remove the duplicates
for (each string t in container) {
out << t;
}
}

```

For now, assume that a word is defined as a whitespace-separated string as delivered by the stream extraction operator. Later on we will consider ways of refining this definition.

Given the way this problem is expressed, we can implement this program directly, if

naïvely. The STL container class `vector` will suffice to hold the words: applying the

algorithms `sort` and `unique` provides the required result.

```

void listWords(istream& in, ostream& out)
{
string s;
vector<string> v;
while (!in.eof() && in >> s)
v.push_back(s); // (1)
sort(v.begin(), v.end());
vector<string>::iterator e
= unique(v.begin(), v.end()); // (2)
for (vector<string>::iterator b = v.begin();
b != e;
b++) {
out << *b << endl;
}
}

```

At (1) the vector member function `push_back()` is used to add to the end of the vector.

This can also be done using the `insert` member, which takes as a parameter an iterator

identifying the position in the vector at which to place the added element:

```
v.insert(v.end(), s);
```

This allows us to add at any position in the vector. Be aware, though, that adding anywhere other than the end implies the overhead of physically shifting all elements from

the insertion point to the end to make room for the new value. For this reason, and given

the choices made in this example, attempts to optimise this code by maintaining the

—

—
vector in sorted order are unwise. Replace vector with list and this becomes possible -

although in both cases a search over the container will be necessary to determine the

correct position of insertion.

The unique algorithm has the surprising property of not changing the length of the container to which it is applied (it can hardly do this, as it has access not to the underlying container, but only to the pair of iterators it is passed). Instead, it guarantees

that duplicates are removed by moving unique entries towards the beginning of the container, returning an iterator indicating the new end of the container. This can be used

directly (as here, at (2)), conversely it can be passed to the erase member with the old end

iterator, to truncate the container.

Question No: 41 (Marks: 10)

Q. Write a detailed note on Exceptions in Destructors with the help of a coding example.

Exceptions in Destructors:

An object is presumably created to do something. Some of the changes made by an object

should persist after an object dies (is destructed) and some changes should not.

Take an

object implementing a SQL query. If a database field is updated via the SQL object then

that change should persist after the SQL objects dies. To do its work the SQL object

probably created a database connection and allocated a bunch of memory. When the SQL

object dies we want to close the database connection and deallocate the memory, otherwise if a lot of SQL objects are created we will run out of database

connections

and/or memory.

The logic might look like:

```
Sql::~Sql()
```

```
{
delete connection;
delete buffer;
}
```

Let's say an exception is thrown while deleting the database connection. Will the buffer

be deleted? No. Exceptions are basically non-local gotos with stack cleanup. The code for

deleting the buffer will never be executed creating a gaping resource leak.

Special care must be taken to catch exceptions which may occur during object destruction. Special care must also be taken to fully destruct an object when it throws an

exception.

Example code for exception

```
#include<iostream.h>
```

```
#include<conio.c>
```

```
class Exception {
```

```
private:
```

```
—
```

```
—
```

```
char message[30] ;
```

```
public:
```

```
Exception() {strcpy(message,"There is not enough stock");}
```

```
char * get_message() { return message; }
```

```
};
```

```
class Item {
```

```
private:
```

```
int stock ;
```

```
int required_quantity;
```

```
public:
```

```
Item(int stk, int qty)
```

```
{
```

```
stock = stk;
```

```
required_quantity = qty;
```

```
}
```

```
int get_stock()
```

```
{
```

```

return stock;
}
int get_required_quantity()
{
return required_quantity;
}
void order()
{
if (get_stock() < get_required_quantity())
throw Exception();
else
cout << "The required quantity of item is available in the stock";
}
~Item(){}
};
void main()
{
Item obj(10, 20);
try

```

—

—

```

{
obj.order();
}
catch(Exception & exp2)
{
getch();
cout << "Exception: " << exp2.get_message() << endl;
}
getch();

```

FINAL TERM EXAMINATION

Fall 2009

CS304- Object Oriented Programming (Session - 4)

Ref No: 1130772

Time: 120 min

Marks: 75

Question No: 1 (Marks: 1) - Please choose one

A template provides a convenient way to make a family of

variables and data members

functions and classes

classes and exceptions

programs and algorithms

Question No: 2 (Marks: 1) - Please choose one

Which one of the following terms must relate to polymorphism?

Static allocation

Static typing

Dynamic binding

Dynamic allocation

—

—

Question No: 3 (Marks: 1) - Please choose one

What is true about function templates?

The compiler generates only one copy of the function template

The compiler generates a copy of function respective to each type of data

The compiler can only generate copy for the int type data

None of the given.

Question No: 4 (Marks: 1) - Please choose one

Which of the following is the best approach if it is required to have more than one functions having exactly same functionality and implemented on different data types?

Templates

Overloading

Data hiding

Encapsulation

Question No: 5 (Marks: 1) - Please choose one
template <>

```
class Vector<char*> { }
```

This is an example of partial specialization.

True

False

Question No: 6 (Marks: 1) - Please choose one

Classes like TwoDimensionalShape and ThreeDimensionalShape would normally be

concrete, while classes like Sphere and Cube would normally be abstract.

True

False

Question No: 7 (Marks: 1) - Please choose one

–

–
A non-virtual member function is defined in a base class and overridden in a derived class; if that function is called through a base-class pointer to a derived class object, the derived-class version is used.

– **True**

– False

Question No: 8 (Marks: 1) - Please choose one

Assume a class Derv that is privately derived from class Base. An object of class Derv

located in main() can access

– public members of Derv.

– **protected members of Derv.**

– private members of Derv.

– protected members of Base.

Question No: 9 (Marks: 1) - Please choose one

In order to define a class template, the first line of definition must be:

– **template <typename T>**

– typename <template T>

– Template Class <ClassName>

– Class <Template T>

Question No: 10 (Marks: 1) - Please choose one

If there is a pointer p to objects of a base class, and it contains the address of an object of

a derived class, and both classes contain a nonvirtual member function, ding(), then the

statement p->ding(); will cause the version of ding() in the _____ class to be executed.

– Base

– Derived

–

–

– Abstract

virtual

Question No: 11 (Marks: 1) - Please choose one

When the base class and the derived class have a member function with the same name,

you must be more specific which function you want to call (using _____).

scope resolution operator

dot operator

null operator

Operator overloading

Question No: 12 (Marks: 1) - Please choose one

Non Template Friend functions of a class are friends of _____instance/s of that class.

All

One specific

All instances of one date type

None of the given options

Question No: 13 (Marks: 1) - Please choose one

The find() algorithm

finds matching sequences of elements in two containers.

finds a container that matches a specified container.

takes iterators as its first two arguments.

takes container elements as its first two arguments.

Question No: 14 (Marks: 1) - Please choose one

If you define a vector v with the default constructor, and define another vector w with a

one-argument constructor to a size of 11, and insert 3 elements into each of these vectors

with push_back(), then the size() member function will return _____ for v and _____ for

w.

11 for v and 3 for w.

0 for v and 0 for w.

0 for v and 3 for w.

3 for v and 11 for w.

Question No: 15 (Marks: 1) - Please choose one

Which of the following may not be an integral part of an object?

- _ State
- _ Behavior
- _ Protected data members

_ All of given

Question No: 16 (Marks: 1) - Please choose one
Which is not the Advantage of inheritance?

- _ providing class growth through natural selection.
- _ facilitating class libraries.**
- _ avoiding the rewriting of code.
- _ providing a useful conceptual framework.

Question No: 17 (Marks: 1) - Please choose one
class DocElement

```
{
public:
virtual void Print() { cout << "Generic element"; }
};
class Heading : public DocElement
{
public:
void Print() { cout << "Heading element"; }
};
class Paragraph : public DocElement
{
public:
void Print() { cout << "Paragraph element"; }
};
```

—

```
—
void main()
{
DocElement * p = new Paragraph();
p->Print();
}
```

When you run this program, it will print out a single line to the console output.
What will be in that line?

Select one correct answer from the following list:

- _ Generic element
- _ Heading element

_ Paragraph element

_ Nothing will be printed.

Question No: 18 (Marks: 1) - Please choose one

When a virtual function is called by referencing a specific object by name and using the

dot member selection operator (e.g., squareObject.draw()), the reference is resolved at compile time.

_ True

_ False

Question No: 19 (Marks: 1) - Please choose one

In case of multiple inheritance a derived class inherits,

_ Only the public member functions of its base classes

_ Only the public data members of its base classes

_ Both public data members and member functions of all its base classes

_ Data members and member functions of any two base classes

Question No: 20 (Marks: 1) - Please choose one

When we write a class template the first line must be:

_

_

_ template < class class_name >

_ template < class data_type >

_ template < class T >

Here T can be replaced with any name but it is preferable.

_ class class-name()

class template<class_name>

Question No: 21 (Marks: 1) - Please choose one

Which of the following is incorrect line regarding function template?

_ template<class T>

_ template <typename U>

_ Class<template T>

_ template < class T, class U >

Question No: 22 (Marks: 1) - Please choose one

An STL container can not be used to,

_ hold objects of class employee.

_ store elements in a way that makes them quickly accessible.

_ compile c++ programs.

_ organize the way objects are stored in memory

Question No: 23 (Marks: 1) - Please choose one
Algorithms can only be implemented using STL containers.

True

False

Question No: 24 (Marks: 1) - Please choose one

Consider a class named Vehicle, which of the following can be the instance of class Vehicle?

—

—

1. Car
2. Computer
3. Desk
4. Ahmed
5. Bicycle
6. Truck

1, 4, 5

2, 5, 6

1, 2, 3, 6

1, 5, 6

Question No: 25 (Marks: 1) - Please choose one

Consider the code below,

```
class Fred {
public:
Fred();
...
};
int main()
{
Fred a[10];
Fred* p = new Fred[10];
...
}
```

Select the best option,

Fred a[10]; calls the default constructor 09 times

Fred* p = new Fred[10]; calls the default constructor 10 times

Produce an error

Fred a[10]; calls the default constructor 11 times

Fred* p = new Fred[10]; calls the default constructor 11 times

Fred a[10]; calls the default constructor 10 times

Fred* p = new Fred[10]; calls the default constructor 10 times

Question No: 26 (Marks: 1) - Please choose one

When a variable is define as static in a class then all object of this class,

Have different copies of this variable

Have same copy of this variable

Can not access this variable

None of given

Question No: 27 (Marks: 1) - Please choose one

The life of sub object is dependant on the life of master class in _____.

Separation

Composition

Aggregation

None of the given

Question No: 28 (Marks: 1) - Please choose one

_____, which means if A declares B as its friend it does NOT mean that A can

access private data of B. It only means that B can access all data of A.

Friendship is one way only

Friendship is two way only

NO Friendship between classes

Any kind of friendship

Question No: 29 (Marks: 1) - Please choose one

Which of the following operators always takes no argument if overloaded?

/

-

+

++

Question No: 30 (Marks: 1) - Please choose one

In Private ----- only member functions and friend classes or functions of a

derived class can convert pointer or reference of derived object to that of parent object

_ specialization

_ inheritance

_ abstraction

_ composition

Question No: 31 (Marks: 1)

Write the syntax of declaring a pure virtual function in a class?

Ans:

Pure Virtual Function is a Virtual function with no body.

Declaration of Pure Virtual Function:

Since pure virtual function has no body, the programmer must add the notation =0 for

declaration of the pure virtual function in the base class.

General Syntax of Pure Virtual Function takes the form:

class classname //This denotes the base class of C++ virtual function

{

public:

virtual void virtualfunctionname() = 0 //This denotes the pure virtual function in

C++

};

Question No: 32 (Marks: 1)

What is meant by direct base class ?

Ans

When a class-type is included in the class-base, it specifies the direct base class of the

class being declared. If a class declaration has no class-base, or if the class-base lists only

interface types, the direct base class is assumed to be object. A class inherits members

from its direct base class,

Deriving a class from more than one direct base class is called multiple inheritance.

Question No: 33 (Marks: 2)

Describe the way to declare a template class as a friend class of any other class.

Ans

The following example is use of a class template:

—

```

—
template<class L> class Key
{
L k;
L* kptr;
int length;
public:
Key(L);
// ...
};

```

Suppose the following declarations appear later:

```

Key<int> i;
Key<char*> c;
Key<mytype> m;

```

The compiler would create three objects.

Question No: 34 (Marks: 2)

What is the purpose of template parameter?

Ans:

There are three kinds of template parameters:

- type
- non-type
- template

You can interchange the keywords class and typename in a template parameter declaration. You cannot use storage class specifiers (static and auto) in a template parameter declaration.

Question No: 35 (Marks: 3)

Describe in simple words how we can use template specialization to enforce case sensitive specialization in String class.

Ans”

The act of creating a new definition of a function, class, or member of a class from a

template declaration and one or more template arguments is called template instantiation.

The definition created from a template instantiation is called a specialization. A primary

template is the template that is being specialized.

create function objects to do the case-insensitive compares, and then reuse them when also wanting to do case-insensitive sorting or searching.

Question No: 36 (Marks: 3)

—

— Can we use compiler generated default assignment operator in case our class is using dynamic memory? Justify your answer.

Ans:

the compiler does not make a separate copy of the object. Even if the types are not the same, the compiler is usually able to do a better job with initialization lists than with assignments.

Consider the following constructor that initializes member object `x_` using an initialization list: `square::square() : x_(whatever) { }`. The most common benefit of doing

this is improved performance. For example, if the expression `whatever` is the same type

as member variable `x_`, the result of the `whatever` expression is constructed directly inside

`x_` — the compiler does not make a separate copy of the object. Even if the types are not

the same, the compiler is usually able to do a better job with initialization lists than with

assignments.

As if that wasn't bad enough, there's another source of inefficiency when using assignment in a constructor: the member object will get fully constructed by its default

constructor, and this might, for example, allocate some default amount of memory or

open some default file. All this work could be for naught if the `whatever` expression

and/or assignment operator causes the object to close that file and/or release that memory

(e.g., if the default constructor didn't allocate a large enough pool of memory or if it

opened the wrong file).

Question No: 37 (Marks: 3)

Give the names of three ways to handle errors in a program.

Ans:

The function will throw `DivideByZero` as an exception that can then be caught by an exception-handling catch statement that catches exceptions of type `int`. The necessary construction for catching exceptions is a try catch system. If you wish to have your program check for exceptions, you must enclose the code that may have exceptions thrown in a try block. The catch statement catches exceptions that are of the proper type. You can, for example, throw objects of a class to differentiate between several different exceptions. As well, once a catch statement is executed, the program continues to run from the end of the catch. The errors can be handled outside of the regular code. This means that it is easier to structure the program code, and it makes dealing with errors more centralized. Finally, because the exception is passed back up the stack of calling functions, you can handle errors at any place you choose.

Question No: 38 (Marks: 5)
Consider the following code,

```
—  
  
—  
class Base{  
private:  
void base1();  
protected:  
void base2();  
public:  
void base3();  
};  
class Derived: public Base{  
private:  
void derived1();  
protected:  
void derived2();  
public:
```

```

void derived3();
};
int main(){
Derived * derived = new Derived();
return 0;
}

```

Fill the table below to tell which member functions of Base and Derived classes we can access using the Derived pointer in the code indicated in bold.

Ans:

Function Name **Availability (Yes / No)?**

base2() **no**

base3() **yes**

derived1() **No**

derived2() **No**

derived3() **Yes**

Question No: 39 (Marks: 5)

What is the output produced by the following program?

```

#include<iostream.h>
void sample_function(double test) throw (int);

```

–

–

```

int main()
{
try
{
cout << "Trying.\n";
sample_function(98.6);
cout << "Trying after call.\n";
}
catch(int)
{
cout << "Catching.\n";
}
cout << "End program.\n";
return 0;
}
void sample_function(double test) throw (int)
{

```

```
cout << "Starting sample_function.\n";
if(test < 100)
throw 42;
}
```

Ans:

Starting sample_function

Trying

Trying after call

Catching

End program

Question No: 40 (Marks: 10)

Write a publicly derived class "Employee" that is derived from base class named "Company". Both classes will have function "create()". Make virtual function of base class and override same function in derived class. Function create will have an

output statement of your own choice.

In "main" Create an object of base class and call both functions with same object type.

—

—

Question No: 41 (Marks: 10)

Write a program in C++ which creates three classes named as

1. Equation
2. Linear
3. Quadratic

Where Linear and Quadratic are inherited from Equation

Each class has the method Graph. Graph method should be pure virtual in Equation class.

This method should be overridden in both the inherited classes. It is meant to display the

Graph shape of its respective class. Graph method of Linear will display the message;

Straight line

Similarly, the Graph method of Quadratic will display the message;

Parabola

In main, call the Graph method of both the Linear and Quadratic equations polymorphically through the parent class (Equation).

Ans:

```
#include "fraction.h"
#include <iostream>
#include <string>
#include <string.h>
#include <stdlib.h>
class equation;
class equation {
int a, b;
public:
int c ()
{return (c);}
void convert (Cequation);
};
class linear {
private:
int side;
public:
void set_side (int a)
{side=a;}
friend class equation;
};

-

-
void equation::convert (Cequation) {
a = 23;
b = 45;
}
int main () {
cequation sqr;
CRectangle rect;
sqr.set_side(4);
rect.convert(sqr);
cout << rect.area();
return 0;
}
```

Question No: 1 (Marks: 1) - Please choose one

Which one of the following terms must relate to **polymorphism**?

- ▶ Static allocation
- ▶ Static typing
- ▶ **Dynamic binding**
- ▶ Dynamic allocation

Question No: 2 (Marks: 1) - Please choose one

Multiple inheritance can be of type

- ▶ Public
- ▶ Private
- ▶ Protected
- ▶ **All of the given**

Question No: 3 (Marks: 1) - Please choose one

When a subclass specifies an alternative definition for an attribute or method of its superclass, it is _____ the definition in the superclass.

- ▶ overload
- ▶ **overriding**
- ▶ copy riding
- ▶ none of given

Question No: 4 (Marks: 1) - Please choose one

Like template functions, a class template may not handle all the types successfully.

▶ True

▶ False

Question No: 5 (Marks: 1) - Please choose one

It is sometimes useful to specify a class from which no objects will ever be created.

▶ True

▶ False

Question No: 6 (Marks: 1) - Please choose one

Assume a class Derv that is privately derived from class Base. An object of class Derv located in main() can access

- ▶ public members of Derv.
- ▶ protected members of Derv.
- ▶ private members of Derv.
- ▶ **protected members of Base.**

Question No: 7 (Marks: 1) - Please choose one

pointer to a base class can point to objects of a derived class. A

- ▶ **True**
- ▶ False

Question No: 8 (Marks: 1) - Please choose one

copy constructor is invoked when A

- ▶ a function do not returns by value.
- ▶ an argument is passed by value.
- ▶ **a function returns by reference.**
- ▶ an argument is passed by reference.

Question No: 9 (Marks: 1) - Please choose one

_____ A
function call is resolved at run-time in _____

- ▶ non-virtual member function.
- ▶ **virtual member function.**
- ▶ Both non-virtual member and virtual member function.
- ▶ None of given

Question No: 10 (Marks: 1) - Please choose one

When the base class and the derived class have a member function with the same name, you must be more specific which function you want to call (using _____).

- ▶ **scope resolution operator**
- ▶ dot operator
- ▶ null operator
- ▶ Operator overloading

Question No: 11 (Marks: 1) - Please choose one

Each try block can have _____ no. of catch blocks.

- ▶ 1
- ▶ 2
- ▶ 3
- ▶ **As many as necessary.**

Question No: 12 (Marks: 1) - Please choose one

Two important STL associative containers are _____ and _____.

- ▶ set,map
- ▶ **sequence,mapping**
- ▶ setmet,multipule
- ▶ sit,mat

Question No: 13 (Marks: 1) - Please choose one

The mechanism of selecting function at run time according to the nature of calling object is called,

- ▶ late binding
- ▶ static binding
- ▶ virtual binding
- ▶ **None of the given options**

Question No: 14 (Marks: 1) - Please choose one

abstract class is useful when, An

- ▶ We do not derive any class from it.
- ▶ There are multiple paths from one derived class to another.
- ▶ **We do not want to instantiate its object.**
- ▶ You want to defer the declaration of the class.

Question No: 15 (Marks: 1) - Please choose one

Which of the following is incorrect line regarding function template?

- ▶ `template<class T>`
- ▶ `template <typename U>`
- ▶ **`Class<template T>`**
- ▶ `template < class T, class U>`

Question No: 16 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

- ▶ Reusability
- ▶ Writability

▶ Maintainability

▶ **All of given**

Question No: 17 (Marks: 1) - Please choose one

_____ By
default the vector data items are initialized to _____

▶ **0**

▶ 0.0

▶ 1

▶ null

Question No: 18 (Marks: 1) - Please choose one

_____ Which one of the following functions returns the total number of elements in a vector.

▶ length();

▶ **size();**

▶ ele();

▶ veclen();

Question No: 19 (Marks: 1) - Please choose one

Suppose you create an uninitialized vector as follows:

```
vector<int> evec;
```

After adding the statment,

```
evec.push_back(21);
```

what will happen?

▶ The following statement will add an element to the start (the back) of evec and will initialize it with the value 21.

▶ The following statement will add an element to the center of evec and will reinitialize it with the value 21.

▶ The following statement will delete an element to the end (the back) of evec and will reinitialize it with the value 21.

▶ **The following statement will add an element to the end (the back) of evec and initialize it with the value 21.**

Question No: 20 (Marks: 1) - Please choose one

STL container can not be used to, An

▶ hold objects of class employee.

- ▶ store elements in a way that makes them quickly accessible.
- ▶ **compile c++ programs.**
- ▶ organize the way objects are stored in memory

Question No: 21 (Marks: 1) - Please choose one

Algorithms can only be implemented using STL containers.

- ▶ True
- ▶ **False**

Question No: 22 (Marks: 1) - Please choose one

The main function of scope resolution operator (::) is,

- ▶ **To define an object**
- ▶ To define a data member
- ▶ To link the definition of an identifier to its declaration
- ▶ To make a class private

Question No: 23 (Marks: 1) - Please choose one

When is a constructor called?

- ▶ Each time the constructor identifier is used in a program statement
- ▶ **During the instantiation of a new object**
- ▶ During the construction of a new class
- ▶ At the beginning of any program execution

Question No: 24 (Marks: 1) - Please choose one

Consider the code below,

```
class Fred {  
public:  
Fred();  
...  
};  
int main()
```

```
{  
Fred a[10];  
Fred* p = new Fred[10];  
...  
}
```

Select the best option,

▶ Fred a[10]; calls the default constructor 09 times

Fred* p = new Fred[10]; calls the default constructor 10 times

▶ **Produce an error**

▶ Fred a[10]; calls the default constructor 11 times

Fred* p = new Fred[10]; calls the default constructor 11 times

▶ Fred a[10]; calls the default constructor 10 times

Fred* p = new Fred[10]; calls the default constructor 10 times

Question No: 25 (Marks: 1) - Please choose one

Associativity can be changed in operator overloading.

▶ True

▶ **False**

Question No: 26 (Marks: 1) - Please choose one

A normal C++ operator that acts in special ways on newly defined data types is said to be

▶ glorified.

▶ encapsulated.

▶ **classified.**

▶ overloaded.

Question No: 27 (Marks: 1) - Please choose one

Which operator can not be overloaded?

- ▶ The relation operator (\geq)
- ▶ Assignment operator (=)
- ▶ Script operator ([])
- ▶ **Conditional operator (? :)**

Question No: 28 (Marks: 1) - Please choose one

Suppose obj1 and obj2 are two objects of a user defined class A. An + operator is overloaded to add obj1 and obj2 using the function call obj1+obj2.

Identify the correct function prototype against the given call?

- ▶ A operator + (A &obj);
- ▶ int + operator();
- ▶ **int operator (plus) ();**
- ▶ A operator(A &obj3);

Question No: 29 (Marks: 1) - Please choose one

Default constructor is such constructor which either has no -----or if it has some parameters these have ----- values

- ▶ Parameter, temporary
- ▶ Null, Parameter
- ▶ **Parameter, default**
- ▶ non of the given

Question No: 30 (Marks: 1) - Please choose one

Public methods of base class can ----- be accessed in its derived class

- ▶ directly
- ▶ **indirectly**
- ▶ simultaneously
- ▶ non of the given

Question No: 31 (Marks: 1)

Is

Deque a Birectional Container?

Yes, deque behaves like queue (line) such that we can add elements on both sides of it.

Question No: 32 (Marks: 1)

What is meant by Generic Programming?

Generic programming refers to programs containing generic abstractions general code that is same in logic for all data types like printArray function), then we instantiate that generic program abstraction (function, class) for a particular data type, such abstractions can work with many different types of data.

Question No: 33 (Marks: 2)

Sort the following data in the order in which compiler searches a function?

Complete Specialization, Generic Template, Partial Specialization, Ordinary Function.

Specializations of this function template, instantiations with specific types, can be called just like an ordinary function:

```
cout << max(3, 7); // outputs 7
```

The compiler examines the arguments used to call max and determines that this is a call to max(int, int). It then instantiates a version of the function where the parameterizing type T is int, making the equivalent of the following function:

```
int max(int x, int y)
{
    return x < y ? y : x;
}
```

the C++ Standard Template Library contains the function template `max(x, y)` which creates functions that return either `x` or `y`, whichever is larger. `max()` could be defined like this:

```
template <typename T>
T max(T x, T y)
{
    return x < y ? y : x;
}
```

Question No: 34 (Marks: 2)

State any conflict that may rise due to multiple inheritance?

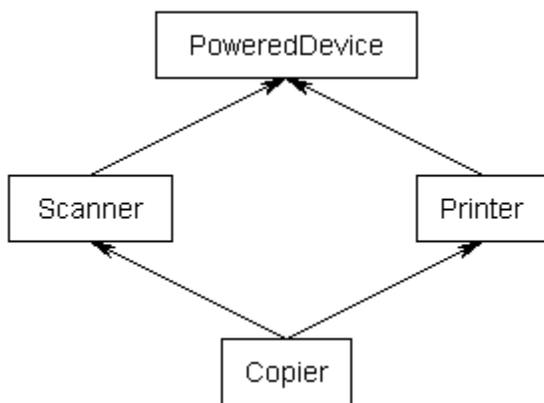

The conflict may arise is the diamond problem, which our author likes to call the “diamond of doom”. This occurs when a class multiply inherits from two classes which each inherit from a single base class. This leads to a diamond shaped inheritance pattern.

For example, consider the following set of classes:

```
class PoweredDevice
{
};

class Scanner: public PoweredDevice
{
};
```

```
classPrinter: publicPoweredDevice
{
};
classCopier: publicScanner, publicPrinter
{
};
```

Scanners and printers are both powered devices, so they derived from PoweredDevice. However, a copy machine incorporates the functionality of both Scanners and Printers.

Ambiguity also cause problem.

Question No: 35 (Marks: 3)

Describe three properties necessary for a container to implement Generic Algorithms.

If you declare a container as holding pointers, you are responsible for managing the memory for the objects pointed to. The container classes will not automatically free memory for these objects when an item is erased from the container.

Container classes are expected to implement methods to do the following:

- create a new empty container (constructor),
- report the number of objects it stores (size),
- delete all the objects in the container (clear),
- insert new objects into the container,
- remove objects from it,
- provide access to the stored objects.

Question No: 36 (Marks: 3)

Write three important features of virtual functions.

With virtual functions, derived classes can provide new implementations of functions from their base classes. When someone calls a virtual function of an object of the derived class, this new implementation is called, even if the caller uses a pointer to the base class, and doesn't even know about the particular derived class.

The virtual function is an option, and the language defaults to non virtual, which is the fastest configuration.

The derived class can completely "override" the implementation or "augment" it (by explicitly calling the base class implementation in addition to the new things it does).

Question No: 37 (Marks: 3)

Consider the code below,

```
#include <iostream>

#include <stdlib.h>

using namespace std;

class Shape{

    public:

    void Draw(){cout<<"shape"<<endl;}

};

class Line : public Shape{

    public:

    void Draw(){cout<<"Line"<<endl;}

};

class Circle : public Shape{

    public:

    void Draw(){cout<<"Circle"<<endl;}

};

int main(int argc, char *argv[])

{

    Shape * ptr1 = new Shape();

    Shape * ptr2 = new Line();

    Shape * ptr3 = new Circle();
```

```
ptr1->Draw();  
ptr2->Draw();  
ptr3->Draw();  
system("PAUSE");  
return 0;  
}
```

This code shows output,

Shape

Shape

Shape

Give the reason for this output

Suppose we want to show the output,

Shape

Line

Circle

How we can change the code to do that?

```

class shape { public:
    void draw();
};
class circle : public shape { };
int main(int argc, char **argv){
    circle my_circle;
    my_circle.draw();
}

```

While this has all the usual advantages, e.g., code reuse, the real power of polymorphism comes into play when draw is declared to be virtual or pure virtual, as follows:

```

class shape{ public:
    virtual void draw()=0;
};
class circle : public shape { public:
    void draw();
}

```

Here, circle has declared its own draw function, which can define behavior appropriate for a circle. Similarly, we could define other classes derived from shape, which provide their own versions of draw. Now, because all the classes implement the shape interface, we can create collections of objects that can provide different behavior invoked in a consistent manner (calling the draw member function). An example of this is shown here.

```

shape *shape_list[3]; // the array that will
                    // pointer to our shape objects
shape[0] = new shape; // three types of shapes
shape[1] = new line; // we have defined
shape[2] = new circle;
for(int i = 0; i < 3; i++){
    shape_list[i].draw();
}

```

When we invoke the draw function for each object on the list, we do not need to know anything about each object; C++ handles the details of invoking the correct version of draw. This is a very powerful technique, allowing us to provide extensibility in our designs. Now we can add new classes derived from shape to provide whatever behavior we desire. The key here is that we have separated the interface (the prototype for shape) from the implementation.

Question No: 38 (Marks: 5)

There are some errors in the code given below, you have to

1. Indicate the line no. with error/s
2. Give the reason for error/s
3. Correct the error/s.

1. #include <iostream> this will be [#include <iostream.h>](#)
2. #include <stdlib.h>

3. using namespace std;
4. template <typename T>
5. class MyClass{
6. public:
7. MyClass(){
8. cout<<"This is class1"<<endl;
9. }
- 10.};
- 11.template <typename T>
- 12.class MyClass<int*>{
- 13.public:
- 14.MyClass(){
- 15.cout<<"This is class2"<<endl;
- 16.}
- 17.};
- 18.int main(int argc, char *argv[])
- 19.{
- 20.MyClass<int> c1;
- 21.MyClass<int*> c2;
- 22.system("PAUSE");
- 23.return 0;
- 24.}

Question No: 39 (Marks: 5)

Given are two classes A and B. class B is inherited from class A. Write a code snippet(for main function) that polymorphically call the method of class B. Also what changes do you suggest in the given code segment that are required to call the class B method polymorphically.

```
class A
{
public:
void method() { cout<<"A's method \n"; }

};

class B : public A
{

public:
void method() { cout<<"B's method\n"; }

};
```

Ans:

```
public class Test
{
public class A {}

public class B extends A {}

private void test(A a)
{
System.out.println("test(A)");
}

private void test(B b)
{
System.out.println("test(B)");
}

public static void main(String[] args)
{
Test t = new Test();
A a = t.new A();
A b = t.new B();

t.test(a);
t.test(b);
}
}
```

Question No: 40 (Marks: 10)

Create built-in STL (Standard Template Library) **vector class object** for **strings** and add in it some words by taking input from user, then apply the `sort()` algorithm to array of words stored in this vector class object.

Hint: Use `push_back()` to add the words in vector class object, and the `[]` operator and `size()` to display these sorted words.

The STL is the containers, iterators and algorithms component of the proposed C++ Standard Library [ANSI95]. It represents a novel application of principles which have their roots in styles of programming other than Object-orientation.

```
void listWords(istream& in, ostream& out)
{
    string s;

    while (!in.eof() && in >> s) {
        add s to some container
    }

    sort the strings in the container
    remove the duplicates

    for (each string t in container) {
        out << t;
    }
}
```

For now, assume that a word is defined as a whitespace-separated string as delivered by the stream extraction operator. Later on we will consider ways of refining this definition.

Given the way this problem is expressed, we can implement this program directly, if naïvely. The STL container class `vector` will suffice to hold the words: applying the algorithms `sort` and `unique` provides the required result.

```
void listWords(istream& in, ostream& out)
{
    string s;
    vector<string> v;

    while (!in.eof() && in >> s)
        v.push_back(s);           // (1)
```

```

sort(v.begin(), v.end());

vector<string>::iterator e
    = unique(v.begin(), v.end()); // (2)

for (vector<string>::iterator b = v.begin();
     b != e;
     b++) {
    out << *b << endl;
}
}

```

At (1) the vector member function `push_back()` is used to add to the end of the vector. This can also be done using the `insert` member, which takes as a parameter an iterator identifying the position in the vector at which to place the added element:

```
v.insert(v.end(), s);
```

This allows us to add at any position in the vector. Be aware, though, that adding anywhere other than the end implies the overhead of physically shifting all elements from the insertion point to the end to make room for the new value. For this reason, and given the choices made in this example, attempts to optimise this code by maintaining the vector in sorted order are unwise. Replace vector with list and this becomes possible - although in both cases a search over the container will be necessary to determine the correct position of insertion.

The `unique` algorithm has the surprising property of not changing the length of the container to which it is applied (it can hardly do this, as it has access not to the underlying container, but only to the pair of iterators it is passed). Instead, it guarantees that duplicates are removed by moving unique entries towards the beginning of the container, returning an iterator indicating the new end of the container. This can be used directly (as here, at (2)), conversely it can be passed to the `erase` member with the old end iterator, to truncate the container.

Question No: 41 (Marks: 10)

Q.

Write a detailed note on Exceptions in Destructors with the help of a coding example.

Exceptions in Destructors:

An object is presumably created to do something. Some of the changes made by an object should persist after an object dies (is destructed) and some changes should not. Take an object implementing a SQL query. If a database field is updated via the SQL object then that change should persist after the SQL objects dies. To do its work the SQL object probably created a database connection and allocated a bunch of memory. When the SQL object dies we want to close the database connection and deallocate the memory, otherwise if a lot of SQL objects are created we will run out of database connections and/or memory.

The logic might look like:

```
Sql::~Sql()
{
    delete connection;
    delete buffer;
}
```

Let's say an exception is thrown while deleting the database connection. Will the buffer be deleted? No. Exceptions are basically non-local gotos with stack cleanup. The code for deleting the buffer will never be executed creating a gaping resource leak.

Special care must be taken to catch exceptions which may occur during object destruction. Special care must also be taken to fully destruct an object when it throws an exception.

Example code for exception

```
#include<iostream.h>
#include<conio.c>
class Exception {
private:
```

```
char message[30] ;
public:

Exception() {strcpy(message,"There is not enough stock");}
char * get_message() { return message; }
};
class Item {
private:

int stock ;
int required_quantity;
public:

Item(int stk, int qty)
{
    stock = stk;
    required_quantity = qty;
}
int get_stock()
{
    return stock;
}

int get_required_quantity()
{
    return required_quantity;
}

void order()
{
    if (get_stock()< get_required_quantity())

        throw Exception();
        else
            cout<<"The required quantity of item is available in the stock";
}

~Item(){}
};
```

```
void main()
{
    Item obj(10, 20);

    try
    {
        obj.order();
    }
    catch(Exception & exp2)
    {
        getch();
        cout << "Exception: " << exp2.get_message() << endl;
    }
    getch();
}
```

FINAL TERM EXAMINATION

SPRING 2010

CS304- OBJECT ORIENTED PROGRAMMING

Shared by IMRAN JEE

Question No: 1 (Marks: 1) - Please choose one

Classes like TwoDimensionalShape and ThreeDimensionalShape would normally be concrete, while classes like Sphere and Cube would normally be abstract.

► True

► False

Question No: 2 (Marks: 1) - Please choose one

Each try block can have _____ no. of catch blocks.

- ▶ 1
- ▶ 2
- ▶ 3
- ▶ **As many as necessary.**

Question No: 3 (Marks: 1) - Please choose one

Function templates should be used where code and behavior must be identical.

- ▶ True
- ▶ **False**

Question No: 4 (Marks: 1) - Please choose one

Consider the following statement

Cupboard has books

What is the relationship between Cupboard and books?

- ▶ Composition
- ▶ **Aggregation**
- ▶ Inheritance
- ▶ None of the given options

Question No: 5 (Marks: 1) - Please choose one

Identify the correct way of declaring an object of user defined template class **A** for char type members?

- ▶ A< char > obj;
- ▶ **A obj;**

▶ A obj;

Imrangee

▶ Obj A;

Question No: 6 (Marks: 1) - Please choose one

The user must define the operation of the copy constructor.

▶ **True**

▶ False

Question No: 7 (Marks: 1) - Please choose one

Default constructor is such constructor which either has no -----or if it has some parameters these have ----- values

▶ Parameter, temporary

▶ Null, Parameter

▶ **Parameter, default**

▶ non of the given

Question No: 8 (Marks: 1) - Please choose one

The type that is used to declare a reference or pointer is called its -----

- ▶ default type
- ▶ **static type**
- ▶ abstract type
- ▶ reference type

Question No: 9 (Marks: 1) - Please choose one

How the information hidden within an object can be accessed?

- ▶ Through its interface
- ▶ Through its private data members
- ▶ **Through its private member functions**
- ▶ Through both public and private members

Question No: 10 (Marks: 1) - Please choose one

The sub-object's life is not dependant on the life of master class in _____.

- ▶ Separation
- ▶ Composition
- ▶ **Aggregation**
- ▶ None of the given

Question No: 11 (Marks: 1) - Please choose one

Encapsulation means

Select correct option:

Imrangee

- ▶ Extending the behaviour of class in another class

- ▶ **Data and behaviour are tightly coupled within an entity**
- ▶ One entity takes all the attributes and operations of the other
- ▶ Taking out the common features and put those in a separate class

Question No: 12 (Marks: 1) - Please choose one

Algorithms can only be implemented using STL containers.

- ▶ True
- ▶ **False**

Question No: 13 (Marks: 1) - Please choose one

When we write a class template the first line must be:

- ▶ `template < class class_name>`
- ▶ `template < class data_type>`
- ▶ **`template < class T >`**

Here T can be replaced with any name but it is preferable.

- ▶ `class class-name()`

`class template<class_name>`

Question No: 14 (Marks: 1) - Please choose one

An STL container can not be used to,

- ▶ **hold objects of class employee.**
- ▶ store elements in a way that makes them quickly accessible.
- ▶ compile c++ programs.
- ▶ organize the way objects are stored in memory

Question No: 15 (Marks: 1) - Please choose one

_____, which means if A declares B as its friend it does NOT mean that

A can access private data of B. It only means that B can access all data of A.

- ▶ **Friendship is one way only**
- ▶ Friendship is two way only
- ▶ NO Friendship between classes
- ▶ Any kind of friendship

Question No: 16 (Marks: 1) - Please choose one

Which of the following may not be an integral part of an object?

- ▶ State

Imrangee

- ▶ Behavior
- ▶ **Protected data members**
- ▶ All of given

Question No: 17 (Marks: 1) - Please choose one

Public methods of base class can ----- be accessed in its derived class

- ▶ **directly**
- ▶ inderectly
- ▶ simultaniously
- ▶ non of the given

Question No: 18 (Marks: 1) - Please choose one

If a class D has been derived using protected inheritance from class B (If B is a protected base and D is derived class) then public and protected members of B - ----- accessed by member functions and friends of class D and classes derived

from D

- ▶ can be
- ▶ cannot be
- ▶ does restrict to be
- ▶ not given

Question No: 19 (Marks: 1) - Please choose one

What is true about function templates?

- ▶ The compiler generates only one copy of the function template
- ▶ **The compiler generates a copy of function respective to each type of data**

- ▶ The compiler can only generate copy for the int type data
- ▶ None of the given.

Question No: 20 (Marks: 1) - Please choose one

Which of the following is an integral part of an object?

- ▶ State
- ▶ Behavior
- ▶ Unique identity
- ▶ **All of the given**

Question No: 21 (Marks: 1) - Please choose one

When the base class and the derived class have a member function with the

Imrangee

same name, you must be more specific which function you want to call (using

_____).

- ▶ scope resolution operator
- ▶ **dot operator**
- ▶ null operator
- ▶ Operator overloading

Question No: 22 (Marks: 2)

Describe the way to declare a template function as a friend of any class.

Question No: 23 (Marks: 2)

Explain two benefits of **constructor**.

Question No: 24 (Marks: 2)

Can a constructor throws an exception. How to handle error when the constructor fails?

Question No: 25 (Marks: 2)

Write the code for a function template

Question No: 26 (Marks: 3)

Write three advantages of Iterator.

Question No: 27 (Marks: 3)

What is the difference between Virtual and Multiple Inheritance?

Question No: 28 (Marks: 5)

What is random_iterator? What is relation between random_iterator and Vector?

Question No: 29 (Marks: 5)

The code given below has one template function as a friend of a template class,

1. You have to identify any error/s in this code and describe the reason for error/s.
2. Give the correct code after removing the error/s.

template

```
void Test(U);
```

```
template< class T >
```

```
class B {
```

```
Imrangee
```

```
int data;
```

```
public:
```

```
friend void Test<>( T );
```

```
};
```

```
template
```

```
void Test(U u){
```

```
B < int> b1;
```

```
b1.data = 7;
```

```
}  
int main(int argc, char *argv[])  
{  
char i;  
Test(i);  
system("PAUSE");  
return 0;  
}
```

FINALTERM EXAMINATION

Spring 2010

CS304- Object Oriented Programming

Time: 90 min

Marks: 58

Question No: 1 (Marks: 1) - Please choose one

A template argument is preceded by the keyword _____.

- ▶ vector
- ▶ class
- ▶ template
- ▶ type*

Question No: 2 (Marks: 1) - Please choose one

Which of the following causes run time binding?

- ▶ Declaring object of abstract class
- ▶ Declaring pointer of abstract class
- ▶ Declaring overridden methods as non-virtual
- ▶ None of the given

Question No: 3 (Marks: 1) - Please choose one

A function template can not be overloaded by another function template.

▶ True

▶ False

Question No: 4 (Marks: 1) - Please choose one

Which of the following is the best approach if it is required to have more than one functions having exactly same functionality and implemented on different data types?

▶ Templates

▶ Overloading

▶ Data hiding

▶ Encapsulation

Question No: 5 (Marks: 1) - Please choose one

Identify the correct way of declaring an object of user defined template class **A** for char type members?

▶ `A< char > obj;`

▶ `<char>A obj;`

▶ A obj<char>;

▶ Obj <char> A;

Question No: 6 (Marks: 1) - Please choose one

The user must define the operation of the copy constructor.

▶ True

▶ False

Question No: 7 (Marks: 1) - Please choose one

Template functions use _____ than ordinary functions.

▶ Greater Memory

▶ Lesser Memory

▶ Equal Memory

▶ None of the given options

Question No: 8 (Marks: 1) - Please choose one

The find() algorithm

- ▶ finds matching sequences of elements in two containers.
- ▶ finds a container that matches a specified container.
- ▶ takes iterators as its first two arguments.
- ▶ takes container elements as its first two arguments.

Question No: 9 (Marks: 1) - Please choose one

Compiler performs _____ type checking to diagnose type errors,

- ▶ Static
- ▶ Dynamic
- ▶ Bound
- ▶ Unbound

Question No: 10 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

- ▶ Reusability
- ▶ Writability
- ▶ Maintainability
- ▶ All of given

Question No: 11 (Marks: 1) - Please choose one

Vectors contain contiguous elements stored as a[an] ____.

- ▶ variable
- ▶ array
- ▶ function
- ▶ datatype

Question No: 12 (Marks: 1) - Please choose one

Suppose you create an uninitialized vector as follows:

```
vector<int> evec;
```

After adding the statment,

```
evec.push_back(21);
```

what will happen?

▶ The following statement will add an element to the start (the back) of evec and will initialize it with the value 21.

▶ The following statement will add an element to the center of evec and will reinitialize it with the value 21.

▶ The following statement will delete an element to the end (the back) of evec and will reinitialize it with the value 21.

▶ The following statement will add an element to the end (the back) of evec and initialize it with the value 21.

Question No: 13 (Marks: 1) - Please choose one

In a de-queue, (chosed the best option)

▶ data can be quickly inserted or deleted at any arbitrary location.

▶ data can be inserted or deleted at any arbitrary location, but the process is relatively slow.

▶ data can not be quickly inserted or deleted at either end.

▶ data can be inserted or deleted at either end, but the process is relatively slow.

Question No: 14 (Marks: 1) - Please choose one

Algorithms can only be implemented using STL containers.

▶ True

▶ False

Question No: 15 (Marks: 1) - Please choose one

What is a class?

▶ A class is a section of computer memory containing objects.

▶ A class is a section of the hard disk reserved for object oriented programs

▶ A class is the part of an object that contains the variables.

▶ A class is a description of a kind of object.

Question No: 16 (Marks: 1) - Please choose one

Inheritance is a way to

- ▶ organize data.
- ▶ pass arguments to objects of classes.
- ▶ add features to existing classes without rewriting them.
- ▶ improve data-hiding and encapsulation.

Question No: 17 (Marks: 1) - Please choose one

We can use "**this**" pointer in the constructor in the body and even in the initialization list of any class if we are careful,

- ▶ True
- ▶ False

Question No: 18 (Marks: 1) - Please choose one

_____ and _____ methods may not be declared abstract.

- ▶ private,static
- ▶ private,public
- ▶ static,public
- ▶ none of given

Question No: 19 (Marks: 1) - Please choose one

Default constructor is such constructor which either has no -----or if it has some parameters these have ----- values

- ▶ Parameter, temporary
- ▶ Null, Parameter
- ▶ Parameter, default
- ▶ non of the given

Question No: 20 (Marks: 1) - Please choose one

Public methods of base class can ----- be accessed in its derived class

- ▶ directly
- ▶ inderectly
- ▶ simultaneously

- ▶ non of the given

Question No: 21 (Marks: 1) - Please choose one

The type that is used to declare a reference or pointer is called its -----

- ▶ default type
- ▶ static type
- ▶ abstract type
- ▶ reference type

Question No: 22 (Marks: 1) - Please choose one

----- members are somewhere between public and private members. They are used in inheritance

- ▶ protected
- ▶ public
- ▶ private
- ▶ global

Question No: 23 (Marks: 1) - Please choose one

Which of these are examples of error handling techniques ?

- ▶ Abnormal Termination
- ▶ Graceful Termination
- ▶ Return the illegal
- ▶ all of the given

Question No: 24 (Marks: 1) - Please choose one

----- follow try block to catch the object thrown

- ▶ catch block
- ▶ throw block
- ▶ main block
- ▶ non of the given

Question No: 25 (Marks: 1) - Please choose one

Graphical representation of the classes and objects is called object model it shows -

- ▶ Class Name only
- ▶ Class Name and attributes
- ▶ Relationships of the objects and classes
- ▶ all of the given

Question No: 26 (Marks: 1) - Please choose one

Destructor can be overloaded

- ▶ True
- ▶ False

Question No: 27 (Marks: 2)

Describe the way to declare a template function as a friend of any class.

Template templename

Class calssname

{

Friend void friend templename (classname <templename> astric const prt
classname);

}

Question No: 28 (Marks: 2)

State any two reasons why the virtual methods can not be static?

1-virtual method can not be static as it is dynamic

2-as virtual method is dynamic so it works automatically that is also another reason

That virtual method can not be static.

Question No: 29 (Marks: 2)

Explain the statement below,

```
vector<int> ivec(4, 3);
```

Question No: 30 (Marks: 2)

Explain two benefits of **setter functions**.

1- It minimize the changes to move the objects in inconsistent states

2- You can write checks in your setter functions to check the validity of data entered by the user, for example age functions to check to calculate the age from date entered.

Question No: 31 (Marks: 3)

Consider the code below,

```
template< typename T >
```

```
class T1 {
```

```
public:  
    T i;  
protected:  
    T j;  
private:  
    T k;  
friend void Test();  
};
```

This code has a template class **T1** with three members **i,j and k** and a friend function **Test()**, you have to describe which member/s of **T1** will be available in function **Test()**.

```
public:  
    T i;  
protected:  
    T j;
```

Question No: 32 (Marks: 3)

What do you mean by Stack unwinding?

When we want to check what happens actually to the local variables in the try block when then an exception is thrown this concept is called stack unwinding.

Question No: 33 (Marks: 3)

Give the c++ code of case sensitive comparison function of string class.

Question No: 34 (Marks: 5)

What is random_iterator? What is relation between random_iterator and Vector?

Random_iterator: it provided both increment and decrement and also provide constant time methods for moving forward and backward in arbitrary sized steps. Random iterator provide essentially all of the operations of ordinary c pointer arithmetic.

Vector class provide an stl style random access iterator for use with generic algorithm since neither the vector nor the matrix classes are container classes in actual. The iterator class is really an iterator of data object that is viewed by vector or matrix.

Question No: 35 (Marks: 5)

What would be the output of this code?

```
class mother {
public:
    mother ()
        { cout << "mother: no parameters\n"; }
    mother (int a)
        { cout << "mother: int parameter\n"; }
};

class daughter : public mother {
public:
    daughter (int a)
        { cout << "daughter: int parameter\n\n"; }
```

```
};  
class son : public mother {  
public:  
    son (int a) : mother (a)  
    { cout << "son: int parameter\n\n"; }  
};  
int main () {  
    daughter rabia (0);  
    son salman(0);  
  
    return 0;  
}
```

Output will be

Mother

Daughter: rabia

Son: salman

Question No: 36 (Marks: 5)

The code given below has one template function as a friend of a template class,

1. You have to identify any error/s in this code and describe the reason for error/s.
2. Give the correct code after removing the error/s.

```
template<typename U>
```

```
void Test(U);  
template< class T >  
class B {  
    int data;  
    public:  
    friend void Test<>( T );  
};  
template<typename U>  
void Test(U u){  
    B <int> b1;  
    b1.data = 7;  
}  
int main(int argc, char *argv[])  
{  
    char i;  
    Test(i);  
    system("PAUSE");  
    return 0;  
}
```

CS304- Object Oriented Programming

Ref No: 1563375

Time: 90 min

Question No: 1 (Marks: 1) - Please choose one

A template argument is preceded by the keyword _____.

▶ vector

▶ class

▶ template

▶ type*

Question No: 2 (Marks: 1) - Please choose one

Which of the following causes run time binding?

- ▶ Declaring object of abstract class
- ▶ Declaring pointer of abstract class
- ▶ Declaring overridden methods as non-virtual
- ▶ None of the given

Question No: 3 (Marks: 1) - Please choose one

A function template can not be overloaded by another function template.

▶ True

▶ False

Question No: 4 (Marks: 1) - Please choose one

Which of the following is the best approach if it is required to have more than one functions having exactly same functionality and implemented on different data types?

▶ Templates

▶ **Overloading**

▶ Data hiding

▶ Encapsulation

Question No: 5 (Marks: 1) - Please choose one

Identify the correct way of declaring an object of user defined template class **A** for char type members?

▶ `A< char > obj;`

▶ `<char>A obj;`

▶ `A obj<char>;`

▶ `Obj <char> A;`

Question No: 6 (Marks: 1) - Please choose one

The user must define the operation of the copy constructor.

▶ True

▶ False

Question No: 7 (Marks: 1) - Please choose one

Template functions use _____ than ordinary functions.

▶ Greater Memory

▶ Lesser Memory

▶ Equal Memory

▶ None of the given options

Question No: 8 (Marks: 1) - Please choose one

The find() algorithm

- ▶ finds matching sequences of elements in two containers.
- ▶ finds a container that matches a specified container.
- ▶ takes iterators as its first two arguments.
- ▶ takes container elements as its first two arguments.

Question No: 9 (Marks: 1) - Please choose one

Compiler performs _____ type checking to diagnose type errors,

▶ Static

▶ Dynamic

▶ Bound

▶ Unbound

Question No: 10 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

▶ Reusability

▶ Writability

▶ Maintainability

▶ All of given

Question No: 11 (Marks: 1) - Please choose one

Vectors contain contiguous elements stored as a[an] ____.

▶ variable

▶ array

▶ function

▶ datatype

Question No: 12 (Marks: 1) - Please choose one

Suppose you create an uninitialized vector as follows:

```
vector<int> evec;
```

After adding the statment,

```
evec.push_back(21);
```

what will happen?

▶ The following statement will add an element to the start (the back) of evec and will initialize it with the value 21.

▶ The following statement will add an element to the center of evec and will reinitialize it with the value 21.

▶ The following statement will delete an element to the end (the back) of evec and will reinitialize it with the value 21.

▶ The following statement will add an element to the end (the back) of evec and initialize it with the value 21.

Question No: 13 (Marks: 1) - Please choose one

In a de-queue, (chosed the best option)

- ▶ data can be quickly inserted or deleted at any arbitrary location.
- ▶ data can be inserted or deleted at any arbitrary location, but the process is relatively slow.
- ▶ data can not be quickly inserted or deleted at either end.
- ▶ data can be inserted or deleted at either end, but the process is relatively slow.

Question No: 14 (Marks: 1) - Please choose one

Algorithms can only be implemented using STL containers.

▶ True

▶ False

Question No: 15 (Marks: 1) - Please choose one

What is a class?

- ▶ A class is a section of computer memory containing objects.
- ▶ A class is a section of the hard disk reserved for object oriented programs
- ▶ A class is the part of an object that contains the variables.
- ▶ A class is a description of a kind of object.

Question No: 16 (Marks: 1) - Please choose one

Inheritance is a way to

- ▶ organize data.

- ▶ pass arguments to objects of classes.
- ▶ add features to existing classes without rewriting them.
- ▶ improve data-hiding and encapsulation.

Question No: 17 (Marks: 1) - Please choose one

We can use "**this**" pointer in the constructor in the body and even in the initialization list of any class if we are careful,

▶ True

▶ False

Question No: 18 (Marks: 1) - Please choose one

_____ and _____ methods may not be declared abstract.

▶ private,static

▶ private,public

▶ static,public

▶ none of given

Question No: 19 (Marks: 1) - Please choose one

Default constructor is such constructor which either has no -----or if it has some parameters these have ----- values

▶ Parameter, temporary

▶ Null, Parameter

▶ Parameter, default

▶ non of the given

Question No: 20 (Marks: 1) - Please choose one

Public methods of base class can ----- be accessed in its derived class

▶ directly

▶ inderectly

▶ simultaneously

- ▶ non of the given

Question No: 21 (Marks: 1) - Please choose one

The type that is used to declare a reference or pointer is called its -----

- ▶ default type
- ▶ static type
- ▶ abstract type
- ▶ reference type

Question No: 22 (Marks: 1) - Please choose one

----- members are somewhere between public and private members. They are used in inheritance

▶ protected

▶ public

▶ private

▶ global

Question No: 23 (Marks: 1) - Please choose one

Which of these are examples of error handling techniques ?

▶ Abnormal Termination

▶ Graceful Termination

▶ Return the illegal

▶ all of the given

Question No: 24 (Marks: 1) - Please choose one

----- follow try block to catch the object thrown

▶ catch block

▶ throw block

▶ main block

▶ non of the given

Question No: 25 (Marks: 1) - Please choose one

Graphical representation of the classes and objects is called object model it shows -

- ▶ Class Name only
- ▶ Class Name and attributes
- ▶ Relationships of the objects and classes
- ▶ all of the given

Question No: 26 (Marks: 1) - Please choose one

Destructor can be overloaded

- ▶ True
- ▶ False

Question No: 27 (Marks: 2)

Describe the way to declare a template function as a friend of any class.

Template templatename

Class calssname

{

Friend void friend templatename (classname <templatename> astric const prt
classname);

}

Question No: 28 (Marks: 2)

State any two reasons why the virtual methods can not be static?

1-virtual method can not be static as it is dynamic

2-as virtual method is dynamic so it works automatically that is also another reason
That virtual method can not be static.

Question No: 29 (Marks: 2)

Explain the statement below,

```
vector<int> ivec(4, 3);
```

Question No: 30 (Marks: 2)

Explain two benefits of **setter functions**.

- 1- It minimize the changes to move the objects in inconsistent states
- 2- You can write checks in your setter functions to check the validity of data entered by the user, for example age functions to check to calculate the age from date entered.

Question No: 31 (Marks: 3)

Consider the code below,

```
template< typename T >
class T1 {
    public:
        T i;
    protected:
        T j;
    private:
        T k;
    friend void Test();
};
```

This code has a template class **T1** with three members **i,j and k** and a friend function **Test()**, you have to describe which member/s of **T1** will be available in function **Test()**.

public:

T i;

protected:

T j;

Question No: 32 (Marks: 3)

What do you mean by Stack unwinding?

When we want to check what happens actually to the local variables in the try block when then an exception is thrown this concept is called stack unwinding.

Question No: 33 (Marks: 3)

Give the c++ code of case sensitive comparison function of string class.

Question No: 34 (Marks: 5)

What is random_iterator? What is relation between random_iterator and Vector?

Random_iterator: it provided both increment and decrement and also provide constant time methods for moving forward and backward in arbitrary sized steps. Random iterator provide essentially all of the operations of ordinary c pointer arithmetic.

Vector class provide an stl style random access iterator for use with generic algorithm since neither the vector nor the matrix classes are container classes in actual. The iterator class is really an iterator of data object that is viewed by vector or matrix.

Question No: 35 (Marks: 5)

What would be the output of this code?

```
class mother {  
public:  
    mother ()  
        { cout << "mother: no parameters\n"; }  
    mother (int a)  
        { cout << "mother: int parameter\n"; }  
};
```

```
};
```

```
class daughter : public mother {  
    public:  
        daughter (int a)  
        { cout << "daughter: int parameter\n\n"; }  
};
```

```
class son : public mother {  
    public:  
        son (int a) : mother (a)  
        { cout << "son: int parameter\n\n"; }  
};
```

```
int main () {  
    daughter rabia (0);  
    son salman(0);  
  
    return 0;  
}
```

Output will be

Mother

Daughter: rabia

Son: salman

Question No: 36 (Marks: 5)

The code given below has one template function as a friend of a template class,

1. You have to identify any error/s in this code and describe the reason for error/s.
2. Give the correct code after removing the error/s.

```
template<typename U>
```

```
void Test(U);
```

```
template< class T >
```

```
class B {
```

```
    int data;
```

```
    public:
```

```
    friend void Test<>( T );
```

```
};
```

```
template<typename U>
void Test(U u){
    B < int> b1;
    b1.data = 7;
}

int main(int argc, char *argv[])
{
    char i;
    Test(i);
    system("PAUSE");
    return 0;
}
```

MUHAMMAD AKRAM ZAHID

FINALTERM EXAMINATION

14 Feb, 2011

CS304- Object Oriented Programming (Session - 3)

Time: 120 min

Question No: 1 (Marks: 1) - Please choose one

Which of the following causes run time binding?

- ▶ Declaring object of abstract class
- ▶ Declaring pointer of abstract class

- ▶ Declaring overridden methods as non-virtual
- ▶ None of the given

Question No: 2 (Marks: 1) - Please choose one

Which of the following is the best approach if it is required to have more than one functions having exactly same functionality and implemented on different data types?

- ▶ Templates
- ▶ Overloading
- ▶ Data hiding
- ▶ Encapsulation

Question No: 3 (Marks: 1) - Please choose one

A copy constructor is invoked when

- ▶ a function do not returns by value.
- ▶ an argument is passed by value.

▶ a function returns by reference.

▶ an argument is passed by reference.

Question No: 4 (Marks: 1) - Please choose one

Like template functions, a class template may not handle all the types successfully.

▶ True

▶ False

Question No: 5 (Marks: 1) - Please choose one

Question No: 6 (Marks: 1) - Please choose one

class template may inherit from another class template. A

▶ True

▶ False

Question No: 7 (Marks: 1) - Please choose one

By default the vector data items are initialized to _____

- ▶ 0
- ▶ 0.0
- ▶ 1
- ▶ null

Question No: 8 (Marks: 1) - Please choose one

In Private ----- only member functions and friend classes or functions of a derived class can convert pointer or reference of derived object to that of parent object

- ▶ specialization
- ▶ inheritance
- ▶ abstraction
- ▶ composition

Question No: 9 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

- ▶ Reusability
- ▶ Writability

- ▶ Maintainability
- ▶ All of given

Question No: 10 (Marks: 1) - Please choose one

Template functions use _____ than ordinary functions.

- ▶ Greater Memory
- ▶ Lesser Memory
- ▶ Equal Memory
- ▶ None of the given options

Question No: 11 (Marks: 1) - Please choose one

Non Template Friend functions of a class are friends of _____instance/s of that class.

- ▶ All
- ▶ One specific
- ▶ All instances of one date type
- ▶ None of the given options

Question No: 12 (Marks: 1) - Please choose one

A copy constructor is invoked when

- ▶ a function do not returns by value.

- ▶ an argument is passed by value.
- ▶ a function returns by reference.
- ▶ an argument is passed by reference.

Question No: 13 (Marks: 1) - Please choose one

A pointer to a base class can point to objects of a derived class.

- ▶ True
- ▶ False

Question No: 14 (Marks: 1) - Please choose one

A template argument is preceded by the keyword _____.

- ▶ vector
- ▶ class
- ▶ template
- ▶ type*

Question No: 15 (Marks: 1) - Please choose one

Which one of the following terms must relate to **polymorphism**?

- ▶ Static allocation
- ▶ Static typing
- ▶ Dynamic binding

- ▶ Dynamic allocation

Question No: 16 (Marks: 1) - Please choose one

Multiple inheritance can be of type

- ▶ Public
- ▶ Private
- ▶ Protected
- ▶ **All of the given**

Question No: 17 (Marks: 1) - Please choose one

Assume a class Derv that is privately derived from class Base. An object of class Derv located in main() can access

- ▶ public members of Derv.
- ▶ protected members of Derv.
- ▶ private members of Derv.
- ▶ **protected members of Base.**

Question No: 18 (Marks: 1) - Please choose one

A copy constructor is invoked when

- ▶ a function do not returns by value.
- ▶ an argument is passed by value.
- ▶ **a function returns by reference.**

- ▶ an argument is passed by reference.

Question No: 19 (Marks: 1) - Please choose one

A function call is resolved at run-time in_____

- ▶ non-virtual member function.
- ▶ **virtual member function.**
- ▶ Both non-virtual member and virtual member function.
- ▶ None of given

Question No: 20 (Marks: 1) - Please choose one

Two important STL associative containers are _____ and _____.

- ▶ set,map
- ▶ **sequence,mapping**
- ▶ setmet,multipule
- ▶ sit,mat

Question No: 21 (Marks: 1) - Please choose one

An abstract class is useful when,

- ▶ We do not derive any class from it.
- ▶ There are multiple paths from one derived class to another.
- ▶ **We do not want to instantiate its object.**

- ▶ You want to defer the declaration of the class.

Question No: 22 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

- ▶ Reusability
- ▶ Writability
- ▶ Maintainability
- ▶ **All of given**

Question No: 23 (Marks: 1) - Please choose one

By default the vector data items are initialized to _____

- ▶ **0**
- ▶ 0.0
- ▶ 1
- ▶ null

Question No: 24 (Marks: 1) - Please choose one

Suppose you create an uninitialized vector as follows:

```
vector<int> evec;
```

After adding the statment,

```
evec.push_back(21);
```

what will happen?

▶ The following statement will add an element to the start (the back) of evec and will initialize it with the value 21.

▶ The following statement will add an element to the center of evec and will reinitialize it with the value 21.

▶ The following statement will delete an element to the end (the back) of evec and will reinitialize it with the value 21.

▶ **The following statement will add an element to the end (the back) of evec and initialize it with the value 21.**

Question No: 25 (Marks: 1) - Please choose one

Default constructor is such constructor which either has no -----or if it has some parameters these have ----- values

▶ Parameter, temporary

▶ Null, Parameter

▶ **Parameter, default**

▶ non of the given

Question No: 26 (Marks: 1) - Please choose one

Which of the following is the best approach if it is required to have more than one functions having exactly same functionality and implemented on different data types?

▶ **Templates**

▶ Overloading

▶ Data hiding

- ▶ Encapsulation

Question No: 27 (Marks: 1)

Describe the way to declare a template class as a friend of any class.

Question No: 28 (Marks: 1)

Classes like TwoDimensionalShape and ThreeDimensionalShape would normally be concrete, while classes like Sphere and Cube would normally be abstract.

- ▶ **True**
- ▶ False

Question No: 29 (Marks: 1)

In order to define a class template, the first line of definition must be:

- ▶ **template <typename T>**
- ▶ typename <template T>
- ▶ Template Class <ClassName>
- ▶ Class <Template T>

Question No: 30 (Marks: 1)

In case of multiple inheritance a derived class inherits,

- ▶ Only the public member functions of its base classes
- ▶ Only the public data members of its base classes

▶ **Both public data members and member functions of all its base classes**

▶ Data members and member functions of any two base classes

Question No: 31 (Marks: 1)

In Private ----- only member functions and friend classes or functions of a derived class can convert pointer or reference of derived object to that of parent object

▶ specialization

▶ inheritance

▶ abstraction

▶ composition

Question No: 32 (Marks: 1)

Which of the following is the best approach if it is required to have more than one functions having exactly same functionality and implemented on different data types?

▶ **Templates**

▶ **Overloading**

▶ **Data hiding**

► **Encapsulation**

Question No: 33 (Marks: 1)

If we declare a function as friend of a template class will it be a friend for a particular data type or for all data types of that class.

Question No: 34 (Marks: 1)

Question No: 35 (Marks: 1)

Question No: 36 (Marks: 1)

Question No: 37 (Marks: 2)

Write three important features of virtual functions.

Question No: 38 (Marks: 5)

There are some errors in the code given below, you have to Indicate the line no. with error/s

Give the reason for error/s

Correct the error/s.

1. #include <iostream>
2. #include <stdlib.h>

3. using namespace std;
4. template <typename T>
5. class MyClass{
6. public:
7. MyClass(){
8. cout<<"This is class1"<<endl;
9. }

```

10.};
11.template <typename T>
12.class MyClass<int*>{
13.public:
14.MyClass(){
15.cout<<"This is class2"<<endl;
16.}
17.};
18.int main(int argc, char *argv[])
19.{
20.MyClass<int> c1;
21.MyClass<int*> c2;
22.system("PAUSE");
23.return 0;
24.}

```

Question No: 39 (Marks: 5)

What is random iterator? What is its relation with vectors?

CS304 Solved By Ms.Shazia

Monday, 08 November 2010 10:40 Zubair Hussain

Date: 08-11-2010

Question # 1 of 10

Information hiding can be achieved through_____.

- 1.Encapsulation, Inheritance
- 2.Encapsulation, Polymorphism
- 3.Encapsulation, Abstraction**
- 4.Overloading

Question # 2 of 10 (Start time: 01:11:21 AM) Total Marks: 1

A good model is related to a real life problem.

Select correct option:

- 1.Loosely
- 2.Openly
- 3.Closely**

Question # 3 of 10 (Start time: 01:12:33 AM) Total Marks: 1

Which of the following features of OOP is used to derive a class from another?

Select correct option:

- 1.Encapsulation
- 2.Polymorphism

Come & Join Us at www.vustudents.net

3.Data hiding

4. Inheritance

Question # 4 of 10 (Start time: 01:13:51 AM) Total Marks: 1

Which of the following is a weak relationship between two objects?

Select correct option:

1. Inheritance
- 2.Composition

3.Aggregation

4.None of given

Question # 5 of 10 (Start time: 01:14:56 AM) Total Marks: 1

Data items in a class must be private.

Select correct option:

1.True

2.False

Question # 6 of 10 (Start time: 01:15:52 AM) Total Marks: 1

Which one is a class association

Select correct option:

1.Simple Association

2. Inheritance

3.Composition

4.Aggregation

Come & Join Us at www.vustudents.net

Question # 7 of 10 (Start time: 01:16:55 AM) Total Marks: 1

Suppose there is an object of type Person, which of the following can be considered as one of its attributes

Select correct option:

1.Name

2.Age

3.Work()

4.Both Name and Age

Question # 8 of 10 (Start time: 01:17:52 AM) Total Marks: 1

Which one is not an object association?

Select correct option:

1.Simple association

2. Inheritance

3.Aggregation

4.Association

Question # 9 of 10 (Start time: 01:18:50 AM) Total Marks: 1

Using encapsulation we can achieve

Select correct option:

1. Information hiding

2.Least interdependencies among modules

3. Implementation independence

4.All of given options

Come & Join Us at www.vustudents.net

Question # 10 of 10 (Start time: 01:19:43 AM) Total Marks: 1

In constant member function the type of this pointer is:

Select correct option:

1.Constant pointer

2.Constant pointer to object

3.Constant pointer to class

4.Constant pointer to constant object

Question # 1 of 10

Which of the following is the way to extract common behavior and attributes from the given classes and make a separate class of those common behaviors and attributes?

1.Generalization

2.Sub-typing

3.Specialization

4.Extension

Question # 2 of 10

The ability to derive a class from more than one class is called

1.Single inheritance

2.Encapsulation

3.Multiple inheritance

4.Polymorphism

Question # 3 of 10:

Come & Join Us at www.vustudents.net

If MyClass has a destructor what is the destructor named?

1.MyClass

2.~MyClass

3.My~Class

4.MyClass~

Question # 4 of 10:

Class abc{ ----- }; Is a valid class declaration?

1.yes

2.no

Question # 5 of 10:

Without using Deep copy constructor, A _____ problem can occur

1.System crash

2.Memory Leakage

3.Dangling pointer

4.All of the given

Question # 6 of 10:

If only one behaviour of a derived class is incompatible with base class, then it is:

1.Generalization

2.Specialization

3.Extension

Come & Join Us at www.vustudents.net

4. Inheritance

Question # 7 of 10:

Which of the following may not be an integral part of an object?

1. state
2. behavior
3. Protected data members

4. All of given

Question # 8 of 10:

Only tangible things can be chosen as an object.

1. True

2. False

1.

2. Question # 1 of 10

Information hiding can be achieved through_____.

Encapsulation, Inheritance

Encapsulation, Polymorphism

Encapsulation, Abstraction

Overloading

Question # 2 of 10 (Start time: 01:11:21 AM) Total Marks: 1

A good model is related to a real life problem.

Protected data members

All of given

Question # 8 of 10:

Only tangible things can be chosen as an object.

True

False

Class is not a mechanism to create objects and define user data types.

1. true

2. **false**

Memory is allocated to non static members only, when:

1. Class is created

2. Object is defined

3. Object is initialized

4. **Object is created**

The sub-object's life is not dependent on the life of master class in _____.

1. Composition

2. **Aggregation**

3. Separation

4. non of the given

Unary operators and assignment operator are right associative.

Come & Join Us at www.vustudents.net

1. **true**

2. false

The >= operator can't be overloaded.

1. true

2. **false**

_____ is creating obj

1. Association

2. **Composition**

3. Aggregation

4. Inheritance

ects of one class inside another class.

If we are create array of objects through new operator, then

1. We can call overloaded constructor through new

2. We can't call overloaded constructor through new

3. We can call default constructor through new

4. **None of the given**

Object can be declared constant with the use of Constant keyword.

1. true
2. false

_____ Operator will take only one operand.

1. New
2. int
3. object
4. none of the given

Which of the following operator(s)

1. ++
2. *
3. %

take(s) one or no argument if overloaded?

FINALTERM EXAMINATION

CS304- Object Oriented Programming (Session - 4)

Question No: 1 (Marks: 1) - Please choose one

Classes like TwoDimensionalShape and ThreeDimensionalShape would normally be

concrete, while classes like Sphere and Cube would normally be abstract.

True

False

Question No: 2 (Marks: 1) - Please choose one

Virtual functions allow you to

create an array of type pointer-to-base class that can hold pointers to derived classes.

create functions that can never be accessed.

group objects of different classes so they can all be accessed by the same function code.

use the same function call to execute member functions of objects from different classes

Question No: 3 (Marks: 1) - Please choose one

A pointer to a base class can point to objects of a derived class.

True

False

Question No: 4 (Marks: 1) - Please choose one

A copy constructor is invoked when

a function do not returns by value.

an argument is passed by value.

a function returns by reference.

an argument is passed by reference.

Question No: 5 (Marks: 1) - Please choose one

Each try block can have _____ no. of catch blocks.

1

2

3

As many as necessary.

Question No: 6 (Marks: 1) - Please choose one

Non Template Friend functions of a class are friends of _____instance/s of that class.

All

One specific

All instances of one date type

None of the given options

Question No: 7 (Marks: 1) - Please choose one

Template functions use _____ than ordinary functions.

Greater Memory

Lesser Memory

Equal Memory

None of the given options

Question No: 8 (Marks: 1) - Please choose one

The find() algorithm

finds matching sequences of elements in two containers.

finds a container that matches a specified container.

- _ takes iterators as its first two arguments.
- _ takes container elements as its first two arguments.

Question No: 9 (Marks: 1) - Please choose one
The copy() algorithm returns an iterator to

- _ the last element copied from.
- _ the last element copied to.
- _ the element one past the last element copied from.
- _ the element one past the last element copied to.

Question No: 10 (Marks: 1) - Please choose one

If you define a vector v with the default constructor, and define another vector w with a

one-argument constructor to a size of 11, and insert 3 elements into each of these vectors

with push_back(), then the size() member function will return _____ for v and _____ for

w.

- _ 11 for v and 3 for w.
- _ 0 for v and 0 for w.
- _ 0 for v and 3 for w.
- _ 3 for v and 11 for w.

Question No: 11 (Marks: 1) - Please choose one

Which is not the Advantage of inheritance?

- _ providing class growth through natural selection.
- _ facilitating class libraries.
- _ avoiding the rewriting of code.
- _ providing a useful conceptual framework.

Question No: 12 (Marks: 1) - Please choose one
class DocElement

```
{
public:
virtual void Print() { cout << "Generic element"; }
};
class Heading : public DocElement
{
public:
void Print() { cout << "Heading element"; }
};
```

```

class Paragraph : public DocElement
{
public:
void Print() { cout << "Paragraph element"; }
};
void main()
{
DocElement * p = new Paragraph();
p->Print();
}

```

When you run this program, it will print out a single line to the console output.
What will be in that line?

Select one correct answer from the following list:

- _ Generic element
- _ Heading element
- _ Paragraph element
- _ Nothing will be printed.

Question No: 13 (Marks: 1) - Please choose one

Which type of inheritance is being represented by the following statement,
class X : public A, public B { };

- _ Single inheritance
- _ Multiple inheritance
- _ Double inheritance
- _ None of the given options

Question No: 14 (Marks: 1) - Please choose one

When we write a class template the first line must be:

- _ template < class class_name >
- _ template < class data_type >
- _ template < class T >

Here T can be replaced with any name but it is preferable.

- _ class class-name()
- class template<class_name>

Question No: 15 (Marks: 1) - Please choose one

Function templates should be used where code and behavior must be identical.

- _ True
- _ False

Question No: 16 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

- Reusability
- Writability
- Maintainability
- All of given

Question No: 17 (Marks: 1) - Please choose one

The specialization pattern <T*> after the name says that this specialization is to be used

for every,

- data type
- meta type
- virtual type

- pointer type

Question No: 18 (Marks: 1) - Please choose one

A range is often supplied to an algorithm by two _____ values.

- italic
- iteration
- iterator
- None of given

Question No: 19 (Marks: 1) - Please choose one

Which of the following is an integral part of an object?

- State
- Behavior
- Unique identity
- All of the given

Question No: 20 (Marks: 1) - Please choose one

Consider the following statement

Cupboard has books

What is the relationship between Cupboard and books?

- Composition
- Aggregation
- Inheritance
- None of the given options

Question No: 21 (Marks: 1) - Please choose one

Which sentence clearly defines an object?

- one instance of a class.

- another word for a class.
- a class with static methods.
- a method that accesses class attributes.

Question No: 22 (Marks: 1) - Please choose one

_____, which means if A declares B as its friend it does NOT mean that A can access private data of B. It only means that B can access all data of A.

- Friendship is one way only
- Friendship is two way only
- NO Friendship between classes
- Any kind of friendship

Question No: 23 (Marks: 1) - Please choose one

The statement `objA=objB;` will cause a compiler error if the objects are of different classes.

- True
- False

Question No: 24 (Marks: 1) - Please choose one

Consider the call given below of an overloaded operator "+",

`Rational_number_1 + Rational_number_2`

Where `Rational_number_1` and `Rational_number_2` are the two objects of `Rational_number` class (a user defined class). Identify which of the above two objects

will be passed as an argument to the overloaded operator function?

- `Rational_number_1`
- `Rational_number_2`
- Both `Rational_number_1` & `Rational_number_2`
- any of the two objects, randomly

Question No: 25 (Marks: 1) - Please choose one

If a class D has been derived using protected inheritance from class B (If B is a protected

base and D is derived class) then public and protected members of B ----- accessed by

member functions and friends of class D and classes derived from D

- can be
- cannot be
- does restrict to be
- not given

Question No: 26 (Marks: 1) - Please choose one

In Private ----- only member functions and friend classes or functions of a derived class can convert pointer or reference of derived object to that of parent object

_ specialization

_ inheritance

_ abstraction

_ composition

Question No: 27 (Marks: 2)

Give two uses of a destructor.

Question No: 28 (Marks: 2)

Describe the way to declare a template class as a friend class of any other class.

Question No: 29 (Marks: 2)

Give the name of two basic types of containers collectively called First class containers?

Question No: 30 (Marks: 2)

State any conflict that may rise due to multiple inheritance?

Question No: 31 (Marks: 3)

What will be the output after executing the following code?

```
class c1{
public:
virtual void function(){
cout<<"I am in c1"<<endl;
```

```
}
```

```
};
```

```
class c2: public c1{
```

```
public:
```

```
void function(){
```

```
cout<<"I am in c2"<<endl;
```

```
}
```

```
};
```

```
class c3: public c1 {
```

```
public:
```

```
void function(){
```

```
cout<<"I am in c3"<<endl;
```

```
}
```

```
};
```

```
int main(){
```

```
c1 * test1 = new c2();
```

```
c1 * test2 = new c3();
```

```
test1->function();
test2->function();
system("PAUSE");
return 0;
}
```

Question No: 32 (Marks: 3)

If we declare a function as friend of a template class will it be a friend for a particular

data type or for all data types of that class.

Question No: 33 (Marks: 3)

Tell the logical error/s in the code given below with reference to resource management;

also describe how we can correct that error/s.

```
class Test{
public:
int function1(){
try{
```

```
FILE *fileptr = fopen("filename.txt","w");
throw exception();
fclose(fileptr);
return 0;
}
catch(Exception e){
...
}
}
};
```

Question No: 34 (Marks: 5)

What is the output produced by the following program?

```
#include<iostream.h>
void sample_function(double test) throw (int);
int main()
{
try
{
cout <<"Trying.\n";
sample_function(98.6);
cout << "Trying after call.\n";
```

```

}
catch(int)
{
cout << "Catching.\n";
}
cout << "End program.\n";
return 0;
}
void sample_function(double test) throw (int)
{
cout << "Starting sample_function.\n";
if(test < 100)
throw 42;
}

```

Question No: 35 (Marks: 5)

The code given below has one template function as a friend of a template class,

1. You have to identify any error/s in this code and describe the reason for error/s.
2. Give the correct code after removing the error/s.

```

template<typename U>
void Test(U);
template< class T >
class B {
int data;
public:
friend void Test<>( T );
};
template<typename U>
void Test(U u){
B < int> b1;
b1.data = 7;
}
int main(int argc, char *argv[])
{
char i;
Test(i);
system("PAUSE");
return 0;
}

```

Question No: 36 (Marks: 5)

Consider the following class,

```
class Base
{
char * p;
public:
Base() { p = new char[10]; }
~Base() { delete [] p; }
};
class Derived : public Base
{
char * q;
public:
Derived() { q = new char[20]; }
~Derived() { delete [] q; }
};
void foo()
{
Base* p = new Derived();

delete p;
}
```

With this program, every time function foo is called, some memory will leak.

Explain why memory will leak. Also, explain how to fix this problem.

FINALTERM EXAMINATION

Fall 2009

CS304- Object Oriented Programming (Session - 1)

Time: 120 min

Marks: 75

Question No: 1 (Marks: 1) - Please choose one

Which one of the following terms must relate to polymorphism?

- Static allocation
- Static typing
- Dynamic binding
- Dynamic allocation

Question No: 2 (Marks: 1) - Please choose one

Multiple inheritance can be of type

- Public
- Private

Protected

All of the given

Question No: 3 (Marks: 1) - Please choose one

When a subclass specifies an alternative definition for an attribute or method of its superclass, it is _____ the definition in the superclass.

overload

overriding

copy riding

none of given

Question No: 4 (Marks: 1) - Please choose one

Like template functions, a class template may not handle all the types successfully.

True

False

Question No: 5 (Marks: 1) - Please choose one

It is sometimes useful to specify a class from which no objects will ever be created.

True

False

Question No: 6 (Marks: 1) - Please choose one

Assume a class Derv that is privately derived from class Base. An object of class Derv

located in main() can access

public members of Derv.

protected members of Derv.

private members of Derv.

protected members of Base.

Question No: 7 (Marks: 1) - Please choose one

A pointer to a base class can point to objects of a derived class.

True

False

Question No: 8 (Marks: 1) - Please choose one

A copy constructor is invoked when

a function do not returns by value.

an argument is passed by value.

a function returns by reference.

an argument is passed by reference.

Question No: 9 (Marks: 1) - Please choose one

A function call is resolved at run-time in _____

- non-virtual member function.
- virtual member function.
- Both non-virtual member and virtual member function.
- None of given

Question No: 10 (Marks: 1) - Please choose one

When the base class and the derived class have a member function with the same name,

you must be more specific which function you want to call (using _____).

scope resolution operator

- dot operator
- null operator
- Operator overloading

Question No: 11 (Marks: 1) - Please choose one

Each try block can have _____ no. of catch blocks.

- 1
- 2
- 3
- As many as necessary.

Question No: 12 (Marks: 1) - Please choose one

Two important STL associative containers are _____ and _____.

- set,map
- sequence,mapping
- setmet,multipule
- sit,mat

Question No: 13 (Marks: 1) - Please choose one

The mechanism of selecting function at run time according to the nature of calling object

is called,

- late binding
- static binding
- virtual binding
- None of the given options

Question No: 14 (Marks: 1) - Please choose one

An abstract class is useful when,

- We do not derive any class from it.

- _ There are multiple paths from one derived class to another.
- _ **We do not want to instantiate its object.**
- _ You want to defer the declaration of the class.

Question No: 15 (Marks: 1) - Please choose one

Which of the following is incorrect line regarding function template?

- _ `template<class T>`
- _ `template <typename U>`
- _ **`Class<template T>`**
- _ `template < class T, class U>`

Question No: 16 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

- _ Reusability
- _ Writability
- _ Maintainability
- _ **All of given**

Question No: 17 (Marks: 1) - Please choose one

By default the vector data items are initialized to _____

- _ **0**
- _ 0.0
- _ 1
- _ null

Question No: 18 (Marks: 1) - Please choose one

Which one of the following functions returns the total number of elements in a vector.

- _ `length();`
- _ **`size();`**
- _ `ele();`
- _ `veclen();`

Question No: 19 (Marks: 1) - Please choose one

Suppose you create an uninitialized vector as follows:

```
vector<int> evec;
```

After adding the statment,

```
evec.push_back(21);
```

what will happen?

- _ The following statement will add an element to the start (the back) of evec and will initialize it with the value 21.
- _ The following statement will add an element to the center of evec and will reinitialize it with the value 21.

_ The following statement will delete an element to the end (the back) of `vec` and will reinitialize it with the value 21.

_ [The following statement will add an element to the end \(the back\) of `vec` and initialize it with the value 21.](#)

Question No: 20 (Marks: 1) - Please choose one

An STL container can not be used to,

- _ hold objects of class `employee`.
- _ store elements in a way that makes them quickly accessible.
- _ [compile c++ programs.](#)
- _ organize the way objects are stored in memory

Question No: 21 (Marks: 1) - Please choose one

Algorithms can only be implemented using STL containers.

_ True

_ [False](#)

Question No: 22 (Marks: 1) - Please choose one

The main function of scope resolution operator (`::`) is,

_ [To define an object](#)

- _ To define a data member
- _ To link the definition of an identifier to its declaration
- _ To make a class private

Question No: 23 (Marks: 1) - Please choose one

When is a constructor called?

- _ Each time the constructor identifier is used in a program statement
- _ [During the instantiation of a new object](#)
- _ During the construction of a new class
- _ At the beginning of any program execution

Question No: 24 (Marks: 1) - Please choose one

Consider the code below,

```
class Fred {
public:
    Fred();
    ...
};
int main()
{
    Fred a[10];
    Fred* p = new Fred[10];
    ...
}
```

}

Select the best option,

- Fred a[10]; calls the default constructor 09 times
- Fred* p = new Fred[10]; calls the default constructor 10 times
- Produce an error
- Fred a[10]; calls the default constructor 11 times
- Fred* p = new Fred[10]; calls the default constructor 11 times
- Fred a[10]; calls the default constructor 10 times
- Fred* p = new Fred[10]; calls the default constructor 10 times

Question No: 25 (Marks: 1) - Please choose one

Associativity can be changed in operator overloading.

- True
- False

Question No: 26 (Marks: 1) - Please choose one

A normal C++ operator that acts in special ways on newly defined data types is said to

be

- glorified.
- encapsulated.
- classified.
- overloaded.

Question No: 27 (Marks: 1) - Please choose one

Which operator can not be overloaded?

- The relation operator (>=)
- Assignment operator (=)
- Script operator ([])
- Conditional operator (? :)

Question No: 28 (Marks: 1) - Please choose one

Suppose obj1 and obj2 are two objects of a user defined class A. An + operator is overloaded to add obj1 and obj2 using the function call obj1+obj2.

Identify the correct function prototype against the given call?

- A operator + (A &obj);
- int + operator();
- int operator (plus) ();
- A operator(A &obj3);

Question No: 29 (Marks: 1) - Please choose one

Default constructor is such constructor which either has no -----or if it has some parameters these have ----- values

- _ Parameter, temporary
- _ Null, Parameter
- _ [Parameter, default](#)
- _ non of the given

Question No: 30 (Marks: 1) - Please choose one

Public methods of base class can ----- be accessed in its derived class

- _ directly
- _ [indirectly](#)
- _ simultaneously
- _ non of the given

Question No: 31 (Marks: 1)

Is Deque a Birectional Container?

[Yes, deque behaves like queue \(line\) such that we can add elements on both sides of it.](#)

Question No: 32 (Marks: 1)

What is meant by Generic Programming?

[Generic programming refers to programs containing generic abstractions general code](#)

[that is same in logic for all data types like printArray function\), then we instantiate that](#)

[generic program abstraction \(function, class\) for a particular data type, such abstractions](#)

[can work with many different types of data.](#)

Question No: 33 (Marks: 2)

Sort the following data in the order in which compiler searches a function?

Complete Specialization, Generic Template, Partial Specialization, Ordinary Function.

[Specializations of this function template, instantiations with specific types, can be called](#)

[just like an ordinary function:](#)

```
cout << max\(3, 7\); // outputs 7
```

[The compiler examines the arguments used to call max and determines that this is a call](#)

[to max\(int, int\). It then instantiates a version of the function where the parameterizing](#)

[type T is int, making the equivalent of the following function:](#)

```
int max(int x, int y)
{
return x < y ? y : x;
}
```

the C++ Standard Template Library contains the function template `max(x, y)` which creates functions that return either `x` or `y`, whichever is larger. `max()` could be defined like

this:

```
template <typename T>
T max(T x, T y)
{
return x < y ? y : x;
}
```

Question No: 34 (Marks: 2)

State any conflict that may rise due to multiple inheritance?

The conflict may arise is the diamond problem, which our author likes to call the “diamond of doom”. This occurs when a class multiply inherits from two classes which

each inherit from a single base class. This leads to a diamond shaped inheritance pattern.

For example, consider the following set of classes:

```
class PoweredDevice
{
};
class Scanner: public PoweredDevice
{
};
class Printer: public PoweredDevice
{
};
class Copier: public Scanner, public Printer
{
};
```

Scanners and printers are both powered devices, so they derived from `PoweredDevice`.

However, a copy machine incorporates the functionality of both Scanners and Printers.

Ambiguity also cause problem.

Question No: 35 (Marks: 3)

Describe three properties necessary for a container to implement Generic Algorithms.

If you declare a container as holding pointers, you are responsible for managing the

memory for the objects pointed to. The container classes will not automatically free

memory for these objects when an item is erased from the container.

Container classes are expected to implement methods to do the following:

- create a new empty container (constructor),
- report the number of objects it stores (size),
- delete all the objects in the container (clear),
- insert new objects into the container,
- remove objects from it,
- provide access to the stored objects.

Question No: 36 (Marks: 3)

Write three important features of virtual functions.

With virtual functions, derived classes can provide new implementations of functions

from their base classes. When someone calls a virtual function of an object of the derived

class, this new implementation is called, even if the caller uses a pointer to the base class,

and doesn't even know about the particular derived class.

The virtual function is an option, and the language defaults to non virtual, which is the

fastest configuration.

The derived class can completely "override" the implementation or "augment" it (by

explicitly calling the base class implementation in addition to the new things it does).

Question No: 37 (Marks: 3)

Consider the code below,

```
#include <iostream>
#include <stdlib.h>
using namespace std;
class Shape{
```

```

public:
void Draw(){cout<<"shape"<<endl;}
};
class Line : public Shape{
public:
void Draw(){cout<<"Line"<<endl;}
};
class Circle : public Shape{
public:
void Draw(){cout<<"Circle"<<endl;}
};
int main(int argc, char *argv[])
{
Shape * ptr1 = new Shape();
Shape * ptr2 = new Line();
Shape * ptr3 = new Circle();
ptr1->Draw();
ptr2->Draw();
ptr3->Draw();
system("PAUSE");
return 0;
}

```

This code shows output,

Shape

Shape

Shape

Give the reason for this output

Suppose we want to show the output,

Shape

Line

Circle

How we can change the code to do that?

```

class shape { public:
void draw();
};
class circle : public shape { };
int main(int argc, char **argv){
circle my_circle;

```

```
my_circle.draw();
}
```

While this has all the usual advantages, e.g., code reuse, the real power of polymorphism

comes into play when draw is declared to be virtual or pure virtual, as follows:

```
class shape{ public:
virtual void draw()=0;
};
class circle : public shape { public:
void draw();
}
```

Here, circle has declared its own draw function, which can define behavior appropriate

for a circle. Similarly, we could define other classes derived from shape, which provide

their own versions of draw. Now, because all the classes implement the shape interface,

we can create collections of objects that can provide different behavior invoked in a consistent

manner (calling the draw member function). An example of this is shown here.

```
shape *shape_list[3]; // the array that will
// pointer to our shape objects
shape[0] = new shape; // three types of shapes
shape[1] = new line; // we have defined
shape[2] = new circle;
for(int i = 0; i < 3; i++){
shape_list[i].draw();
}
```

When we invoke the draw function for each object on the list, we do not need to know

anything about each object; C++ handles the details of invoking the correct version of

draw. This is a very powerful technique, allowing us to provide extensibility in our designs. Now we can add new classes derived from shape to provide whatever behavior

we desire. The key here is that we have separated the interface (the prototype for shape)

from the implementation.

Question No: 38 (Marks: 5)

There are some errors in the code given below, you have to

1. Indicate the line no. with error/s
2. Give the reason for error/s
3. Correct the error/s.

```

1. #include <iostream> this will be #include <iostream.h>
2. #include <stdlib.h>
3. using namespace std;
4. template <typename T>
5. class MyClass{
6. public:
7. MyClass(){
8. cout<<"This is class1"<<endl;
9. }
10. };
11. template <typename T>
12. class MyClass<int*>{
13. public:
14. MyClass(){
15. cout<<"This is class2"<<endl;
16. }
17. };
18. int main(int argc, char *argv[])
19. {
20. MyClass<int> c1;
21. MyClass<int*> c2;
22. system("PAUSE");
23. return 0;
24. }

```

Question No: 39 (Marks: 5)

Given are two classes A and B. class B is inherited from class A. Write a code snippet (for main function) that polymorphically call the method of class B. Also what changes do you suggest in the given code segment that are required to call the class B method polymorphically.

```

class A
{
public:
void method() { cout<<"A's method \n"; }

```

```
};
class B : public A
{
public:
void method() { cout<<"B's method\n"; }
```

```
};
Ans:
public class Test
{
public class A {}
public class B extends A {}
private void test(A a)
{
System.out.println("test(A)");
}
private void test(B b)
{
System.out.println("test(B)");
}
public static void main(String[] args)
{
Test t = new Test();
A a = t.new A();
A b = t.new B();
t.test(a);
t.test(b);
}
}
```

Question No: 40 (Marks: 10)

Create built-in STL (Standard Template Library) vector class object for strings and add in it some words by taking input from user, then apply the sort() algorithm to array of words stored in this vector class object.

Hint: Use push_back() to add the words in vector class object, and the [] operator and size() to display these sorted words.

The STL is the containers, iterators and algorithms component of the proposed C++

Standard Library [ANSI95]. It represents a novel application of principles which have

their roots in styles of programming other than Object-orientation.
 void listWords(istream& in, ostream& out)

```
{
string s;
while (!in.eof() && in >> s) {
add s to some container
}
sort the strings in the container
remove the duplicates
for (each string t in container) {
out << t;
}
}
```

For now, assume that a word is defined as a whitespace-separated string as delivered by

the stream extraction operator. Later on we will consider ways of refining this definition.

Given the way this problem is expressed, we can implement this program directly, if

naïvely. The STL container class vector will suffice to hold the words: applying the

algorithms sort and unique provides the required result.

```
void listWords(istream& in, ostream& out)
{
string s;
vector<string> v;
while (!in.eof() && in >> s)
v.push_back(s); // (1)
sort(v.begin(), v.end());
vector<string>::iterator e
= unique(v.begin(), v.end()); // (2)
for (vector<string>::iterator b = v.begin();
b != e;
b++) {
out << *b << endl;
}
}
```

At (1) the vector member function `push_back()` is used to add to the end of the vector.

This can also be done using the `insert` member, which takes as a parameter an iterator

identifying the position in the vector at which to place the added element:

```
v.insert(v.end(), s);
```

This allows us to add at any position in the vector. Be aware, though, that adding anywhere other than the end implies the overhead of physically shifting all elements from

the insertion point to the end to make room for the new value. For this reason, and given

the choices made in this example, attempts to optimise this code by maintaining the

vector in sorted order are unwise. Replace vector with list and this becomes possible -

although in both cases a search over the container will be necessary to determine the

correct position of insertion.

The unique algorithm has the surprising property of not changing the length of the container to which it is applied (it can hardly do this, as it has access not to the underlying container, but only to the pair of iterators it is passed). Instead, it guarantees

that duplicates are removed by moving unique entries towards the beginning of the container, returning an iterator indicating the new end of the container. This can be used

directly (as here, at (2)), conversely it can be passed to the `erase` member with the old end

iterator, to truncate the container.

Question No: 41 (Marks: 10)

Q. Write a detailed note on Exceptions in Destructors with the help of a coding example.

Exceptions in Destructors:

An object is presumably created to do something. Some of the changes made by an object

should persist after an object dies (is destructed) and some changes should not.

Take an

object implementing a SQL query. If a database field is updated via the SQL object then

that change should persist after the SQL objects dies. To do its work the SQL object probably created a database connection and allocated a bunch of memory. When the SQL object dies we want to close the database connection and deallocate the memory, otherwise if a lot of SQL objects are created we will run out of database connections and/or memory.

The logic might look like:

```
Sql::~Sql()
{
delete connection;
delete buffer;
}
```

Let's say an exception is thrown while deleting the database connection. Will the buffer

be deleted? No. Exceptions are basically non-local gotos with stack cleanup. The code for

deleting the buffer will never be executed creating a gaping resource leak.

Special care must be taken to catch exceptions which may occur during object destruction. Special care must also be taken to fully destruct an object when it throws an exception.

Example code for exception

```
#include<iostream.h>
#include<conio.c>
class Exception {
private:

char message[30] ;
public:
Exception() {strcpy(message,"There is not enough stock");}
char * get_message() { return message; }
};
class Item {
private:
int stock ;
int required_quantity;
public:
```

```
Item(int stk, int qty)
{
stock = stk;
required_quantity = qty;
}
int get_stock()
{
return stock;
}
int get_required_quantity()
{
return required_quantity;
}
void order()
{
if (get_stock() < get_required_quantity())
throw Exception();
else
cout << "The required quantity of item is available in the stock";
}
~Item(){}
};
void main()
{
Item obj(10, 20);
try

{
obj.order();
}
catch(Exception & exp2)
{
getch();
cout << "Exception: " << exp2.get_message() << endl;
}
getch();
```

FINAL TERM EXAMINATION

Fall 2009

CS304- Object Oriented Programming (Session - 4)

Ref No: 1130772

Time: 120 min

Marks: 75

Question No: 1 (Marks: 1) - Please choose one

A template provides a convenient way to make a family of

- variables and data members**
- functions and classes
- classes and exceptions
- programs and algorithms

Question No: 2 (Marks: 1) - Please choose one

Which one of the following terms must relate to polymorphism?

- Static allocation
- Static typing
- Dynamic binding**
- Dynamic allocation

Question No: 3 (Marks: 1) - Please choose one

What is true about function templates?

- The compiler generates only one copy of the function template
- The compiler generates a copy of function respective to each type of data**
- The compiler can only generate copy for the int type data
- None of the given.

Question No: 4 (Marks: 1) - Please choose one

Which of the following is the best approach if it is required to have more than one functions having exactly same functionality and implemented on different data types?

- Templates**
- Overloading
- Data hiding
- Encapsulation

Question No: 5 (Marks: 1) - Please choose one
template <>

```
class Vector<char*> { }
```

This is an example of partial specialization.

- True
- False**

Question No: 6 (Marks: 1) - Please choose one

Classes like TwoDimensionalShape and ThreeDimensionalShape would normally be

concrete, while classes like Sphere and Cube would normally be abstract.

True

False

Question No: 7 (Marks: 1) - Please choose one

A non-virtual member function is defined in a base class and overridden in a derived class; if that function is called through a base-class pointer to a derived class object, the derived-class version is used.

True

False

Question No: 8 (Marks: 1) - Please choose one

Assume a class Derv that is privately derived from class Base. An object of class Derv

located in main() can access

public members of Derv.

protected members of Derv.

private members of Derv.

protected members of Base.

Question No: 9 (Marks: 1) - Please choose one

In order to define a class template, the first line of definition must be:

`template <typename T>`

`typename <template T>`

`Template Class <ClassName>`

`Class <Template T>`

Question No: 10 (Marks: 1) - Please choose one

If there is a pointer p to objects of a base class, and it contains the address of an object of

a derived class, and both classes contain a nonvirtual member function, ding(), then the

statement `p->ding();` will cause the version of ding() in the _____ class to be executed.

Base

Derived

Abstract

virtual

Question No: 11 (Marks: 1) - Please choose one

When the base class and the derived class have a member function with the same name,

you must be more specific which function you want to call (using _____).

scope resolution operator

dot operator

null operator

Operator overloading

Question No: 12 (Marks: 1) - Please choose one

Non Template Friend functions of a class are friends of _____instance/s of that class.

All

One specific

All instances of one date type

None of the given options

Question No: 13 (Marks: 1) - Please choose one

The find() algorithm

finds matching sequences of elements in two containers.

finds a container that matches a specified container.

takes iterators as its first two arguments.

takes container elements as its first two arguments.

Question No: 14 (Marks: 1) - Please choose one

If you define a vector v with the default constructor, and define another vector w with a

one-argument constructor to a size of 11, and insert 3 elements into each of these vectors

with push_back(), then the size() member function will return _____ for v and _____ for

w.

11 for v and 3 for w.

0 for v and 0 for w.

0 for v and 3 for w.

3 for v and 11 for w.

Question No: 15 (Marks: 1) - Please choose one

Which of the following may not be an integral part of an object?

State

Behavior

Protected data members

All of given

Question No: 16 (Marks: 1) - Please choose one
Which is not the Advantage of inheritance?

- _ providing class growth through natural selection.
- _ facilitating class libraries.**
- _ avoiding the rewriting of code.
- _ providing a useful conceptual framework.

Question No: 17 (Marks: 1) - Please choose one
class DocElement

```
{
public:
virtual void Print() { cout << "Generic element"; }
};
class Heading : public DocElement
{
public:
void Print() { cout << "Heading element"; }
};
class Paragraph : public DocElement
{
public:
void Print() { cout << "Paragraph element"; }
};
```

```
void main()
{
DocElement * p = new Paragraph();
p->Print();
}
```

When you run this program, it will print out a single line to the console output.
What will be in that line?

Select one correct answer from the following list:

- _ Generic element
- _ Heading element
- _ Paragraph element**
- _ Nothing will be printed.

Question No: 18 (Marks: 1) - Please choose one

When a virtual function is called by referencing a specific object by name and using the

dot member selection operator (e.g., squareObject.draw()), the reference is resolved at compile time.

True

False

Question No: 19 (Marks: 1) - Please choose one

In case of multiple inheritance a derived class inherits,

Only the public member functions of its base classes

Only the public data members of its base classes

Both public data members and member functions of all its base classes

Data members and member functions of any two base classes

Question No: 20 (Marks: 1) - Please choose one

When we write a class template the first line must be:

template < class class_name >

template < class data_type >

template < class T >

Here T can be replaced with any name but it is preferable.

class class-name()

class template<class_name>

Question No: 21 (Marks: 1) - Please choose one

Which of the following is incorrect line regarding function template?

template<class T>

template <typename U>

Class<template T>

template < class T, class U >

Question No: 22 (Marks: 1) - Please choose one

An STL container can not be used to,

hold objects of class employee.

store elements in a way that makes them quickly accessible.

compile c++ programs.

organize the way objects are stored in memory

Question No: 23 (Marks: 1) - Please choose one

Algorithms can only be implemented using STL containers.

True

False

Question No: 24 (Marks: 1) - Please choose one

Consider a class named Vehicle, which of the following can be the instance of class

Vehicle?

1. Car
 2. Computer
 3. Desk
 4. Ahmed
 5. Bicycle
 6. Truck
- 1, 4, 5
 2, 5, 6
 1, 2, 3, 6
 1, 5, 6

Question No: 25 (Marks: 1) - Please choose one

Consider the code below,

```

class Fred {
public:
Fred();
...
};
int main()
{
Fred a[10];
Fred* p = new Fred[10];
...
}
  
```

Select the best option,

- Fred a[10]; calls the default constructor 09 times
 Fred* p = new Fred[10]; calls the default constructor 10 times
 Produce an error
 Fred a[10]; calls the default constructor 11 times
 Fred* p = new Fred[10]; calls the default constructor 11 times
 Fred a[10]; calls the default constructor 10 times
 Fred* p = new Fred[10]; calls the default constructor 10 times

Question No: 26 (Marks: 1) - Please choose one

When a variable is define as static in a class then all object of this class,

- Have different copies of this variable
 Have same copy of this variable
 Can not access this variable
 None of given

Question No: 27 (Marks: 1) - Please choose one

The life of sub object is dependant on the life of master class in _____.

- Separation
- Composition
- Aggregation
- None of the given

Question No: 28 (Marks: 1) - Please choose one

_____, which means if A declares B as its friend it does NOT mean that A can

access private data of B. It only means that B can access all data of A.

- Friendship is one way only
- Friendship is two way only
- NO Friendship between classes
- Any kind of friendship

Question No: 29 (Marks: 1) - Please choose one

Which of the following operators always takes no argument if overloaded?

- /
-
- +
- ++

Question No: 30 (Marks: 1) - Please choose one

In Private ----- only member functions and friend classes or functions of a derived class can convert pointer or reference of derived object to that of parent object

- specialization
- inheritance
- abstraction
- composition

Question No: 31 (Marks: 1)

Write the syntax of declaring a pure virtual function in a class?

Ans:

Pure Virtual Function is a Virtual function with no body.

Declaration of Pure Virtual Function:

Since pure virtual function has no body, the programmer must add the notation =0 for

declaration of the pure virtual function in the base class.

General Syntax of Pure Virtual Function takes the form:

class classname //This denotes the base class of C++ virtual function

```
{
public:
virtual void virtualfunctionname() = 0 //This denotes the pure virtual function in
C++
};
```

Question No: 32 (Marks: 1)

What is meant by direct base class ?

Ans

When a class-type is included in the class-base, it specifies the direct base class of the

class being declared. If a class declaration has no class-base, or if the class-base lists only

interface types, the direct base class is assumed to be object. A class inherits members

from its direct base class,

Deriving a class from more than one direct base class is called multiple inheritance.

Question No: 33 (Marks: 2)

Describe the way to declare a template class as a friend class of any other class.

Ans

The following example is use of a class template:

```
template<class L> class Key
{
L k;
L* kptr;
int length;
public:
Key(L);
// ...
};
```

Suppose the following declarations appear later:

```
Key<int> i;
```

```
Key<char*> c;
```

```
Key<mytype> m;
```

The compiler would create three objects.

Question No: 34 (Marks: 2)

What is the purpose of template parameter?

Ans:

There are three kinds of template parameters:

- type
- non-type
- template

You can interchange the keywords `class` and `typename` in a template parameter declaration. You cannot use storage class specifiers (`static` and `auto`) in a template parameter declaration.

Question No: 35 (Marks: 3)

Describe in simple words how we can use template specialization to enforce case sensitive specialization in `String` class.

Ans”

The act of creating a new definition of a function, class, or member of a class from a

template declaration and one or more template arguments is called template instantiation.

The definition created from a template instantiation is called a specialization. A

primary template is the template that is being specialized.

create function objects to do the case-insensitive compares, and then reuse them when also wanting to do case-insensitive sorting or searching.

Question No: 36 (Marks: 3)

Can we use compiler generated default assignment operator in case our class is using dynamic memory? Justify your answer.

Ans:

the compiler does not make a separate copy of the object. Even if the types are not the

same, the compiler is usually able to do a better job with initialization lists than with

assignments.

Consider the following constructor that initializes member object `x_` using an initialization list: `square::square() : x_(whatever) { }`. The most common benefit of doing

this is improved performance. For example, if the expression `whatever` is the same type

as member variable `x_`, the result of the `whatever` expression is constructed directly inside

x_ — the compiler does not make a separate copy of the object. Even if the types are not the same, the compiler is usually able to do a better job with initialization lists than with assignments.

As if that wasn't bad enough, there's another source of inefficiency when using assignment in a constructor: the member object will get fully constructed by its default constructor, and this might, for example, allocate some default amount of memory or open some default file. All this work could be for naught if the whatever expression and/or assignment operator causes the object to close that file and/or release that memory (e.g., if the default constructor didn't allocate a large enough pool of memory or if it opened the wrong file).

Question No: 37 (Marks: 3)

Give the names of three ways to handle errors in a program.

Ans:

The function will throw DivideByZero as an exception that can then be caught by an exception-handling catch statement that catches exceptions of type int. The necessary construction for catching exceptions is a try catch system. If you wish to have your program check for exceptions, you must enclose the code that may have exceptions thrown in a try block.

The catch statement catches exceptions that are of the proper type. You can, for example, throw objects of a class to differentiate between several different exceptions. As well, once a catch statement is executed, the program continues to run from the end of the catch.

the errors can be handled outside of the regular code. This means that it is easier to structure the program code, and it makes dealing with errors more centralized.

Finally,

because the exception is passed back up the stack of calling functions, you can handle errors at any place you choose.

Question No: 38 (Marks: 5)
Consider the following code,

```
class Base{
private:
void base1();
protected:
void base2();
public:
void base3();
};
class Derived: public Base{
private:
void derived1();
protected:
void derived2();
public:
void derived3();
};
int main(){
Derived * derived = new Derived();
return 0;
}
```

Fill the table below to tell which member functions of Base and Derived classes we can access using the Derived pointer in the code indicated in bold.

Ans:

Function Name **Availability (Yes / No)?**

base2() **no**

base3() **yes**

derived1() **No**

derived2() **No**

derived3() **Yes**

Question No: 39 (Marks: 5)

What is the output produced by the following program?

```
#include<iostream.h>
```

```
void sample_function(double test) throw (int);
```

```
int main()
```

```
{
```

```

try
{
cout << "Trying.\n";
sample_function(98.6);
cout << "Trying after call.\n";
}
catch(int)
{
cout << "Catching.\n";
}
cout << "End program.\n";
return 0;
}
void sample_function(double test) throw (int)
{
cout << "Starting sample_function.\n";
if(test < 100)
throw 42;
}

```

Ans:

Starting sample_function

Trying

Trying after call

Catching

End program

Question No: 40 (Marks: 10)

Write a publicly derived class "Employee" that is derived from base class named "Company". Both classes will have function "create()". Make virtual function of base class and override same function in derived class. Function create will have an

output statement of your own choice.

In "main" Create an object of base class and call both functions with same object type.

Question No: 41 (Marks: 10)

Write a program in C++ which creates three classes named as

1. Equation
2. Linear
3. Quadratic

Where Linear and Quadratic are inherited from Equation

Each class has the method Graph. Graph method should be pure virtual in Equation class.

This method should be overridden in both the inherited classes. It is meant to display the

Graph shape of its respective class. Graph method of Linear will display the message;

Straight line

Similarly, the Graph method of Quadratic will display the message;

Parabola

In main, call the Graph method of both the Linear and Quadratic equations polymorphically through the parent class (Equation).

Ans:

```
#include "fraction.h"
#include <iostream>
#include <string>
#include <string.h>
#include <stdlib.h>
class equation;
class equation {
int a, b;
public:
int c ()
{return (c);}
void convert (Cequation);
};
class linear {
private:
int side;
public:
void set_side (int a)
{side=a;}
friend class equation;
};

void equation::convert (Cequation) {
a = 23;
b = 45;
}
int main () {
```

```
cequation sqr;  
CRectangle rect;  
sqr.set_side(4);  
rect.convert(sqr);  
cout << rect.area();  
return 0;  
}
```

FINALTERM EXAMINATION

CS304- Object Oriented Programming (Session - 1)

3

Question No: 1 (Marks: 1) - Please choose one

Which one of the following terms must relate to **polymorphism**?

- ▶ Static allocation
- ▶ Static typing
- ▶ **Dynamic binding**
- ▶ Dynamic allocation

Question No: 2 (Marks: 1) - Please choose one

Multiple inheritance can be of type

- ▶ Public
- ▶ Private
- ▶ Protected
- ▶ **All of the given**

Question No: 3 (Marks: 1) - Please choose one

When a subclass specifies an alternative definition for an attribute or method of its superclass, it is _____ the definition in the superclass.

- ▶ overload
- ▶ **overriding**
- ▶ copy riding
- ▶ none of given

Question No: 4 (Marks: 1) - Please choose one

Like template functions, a class template may not handle all the types successfully.

- ▶ **True**
- ▶ False

Question No: 5 (Marks: 1) - Please choose one

_____ It is sometimes useful to specify a class from which no objects will ever be created.

- ▶ True

▶ **False**

Question No: 6 (Marks: 1) - Please choose one

Assume a class Derv that is privately derived from class Base. An object of class Derv located in main() can access

- ▶ public members of Derv.
- ▶ protected members of Derv.
- ▶ private members of Derv.
- ▶ **protected members of Base.**

Question No: 7 (Marks: 1) - Please choose one

_____ A
pointer to a base class can point to objects of a derived class.

▶ **True**

▶ False

Question No: 8 (Marks: 1) - Please choose one

copy constructor is invoked when A

- ▶ a function do not returns by value.
- ▶ an argument is passed by value.
- ▶ **a function returns by reference.**
- ▶ an argument is passed by reference.

Question No: 9 (Marks: 1) - Please choose one

function call is resolved at run-time in_____ A

- ▶ non-virtual member function.
- ▶ **virtual member function.**
- ▶ Both non-virtual member and virtual member function.
- ▶ None of given

Question No: 10 (Marks: 1) - Please choose one

When the base class and the derived class have a member function with the same name, you must be more specific which function you want to call (using _____).

- ▶ **scope resolution operator**
- ▶ dot operator
- ▶ null operator
- ▶ Operator overloading

Question No: 11 (Marks: 1) - Please choose one

Each try block can have _____ no. of catch blocks.

- ▶ 1
- ▶ 2
- ▶ 3
- ▶ **As many as necessary.**

Question No: 12 (Marks: 1) - Please choose one

Two important STL associative containers are _____ and _____.

- ▶ set,map
- ▶ **sequence,mapping**
- ▶ setmultimap,multimap
- ▶ set,map

Question No: 13 (Marks: 1) - Please choose one

The mechanism of selecting function at run time according to the nature of calling object is called,

- ▶ late binding
- ▶ static binding
- ▶ virtual binding
- ▶ **None of the given options**

Question No: 14 (Marks: 1) - Please choose one

abstract class is useful when, An

- ▶ We do not derive any class from it.

- ▶ There are multiple paths from one derived class to another.
- ▶ **We do not want to instantiate its object.**
- ▶ You want to defer the declaration of the class.

Question No: 15 (Marks: 1) - Please choose one

Which of the following is incorrect line regarding function template?

- ▶ `template<class T>`
- ▶ `template <typename U>`
- ▶ **`Class<template T>`**
- ▶ `template < class T, class U>`

Question No: 16 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

- ▶ Reusability
- ▶ Writability
- ▶ Maintainability
- ▶ **All of given**

Question No: 17 (Marks: 1) - Please choose one

_____ By
default the vector data items are initialized to _____

- ▶ **0**
- ▶ 0.0
- ▶ 1
- ▶ null

Question No: 18 (Marks: 1) - Please choose one

Which one of the following functions returns the total number of elements in a vector.

- ▶ length();
- ▶ **size();**
- ▶ ele();
- ▶ veclen();

Question No: 19 (Marks: 1) - Please choose one

Suppose you create an uninitialized vector as follows:

```
vector<int> evec;
```

After adding the statment,

```
evec.push_back(21);
```

what will happen?

- ▶ The following statement will add an element to the start (the back) of evec and will initialize it with the value 21.
- ▶ The following statement will add an element to the center of evec and will reinitialize it with the value 21.
- ▶ The following statement will delete an element to the end (the back) of evec and will reinitialize it with the value 21.
- ▶ **The following statement will add an element to the end (the back) of evec and initialize it with the value 21.**

Question No: 20 (Marks: 1) - Please choose one

STL container can not be used to, An

- ▶ hold objects of class employee.
- ▶ store elements in a way that makes them quickly accessible.
- ▶ **compile c++ programs.**
- ▶ organize the way objects are stored in memory

Question No: 21 (Marks: 1) - Please choose one

Algorithms can only be implemented using STL containers.

- ▶ True
- ▶ **False**

Question No: 22 (Marks: 1) - Please choose one

The main function of scope resolution operator (::) is,

- ▶ **To define an object**
- ▶ To define a data member
- ▶ To link the definition of an identifier to its declaration
- ▶ To make a class private

Question No: 23 (Marks: 1) - Please choose one

When is a constructor called?

- ▶ Each time the constructor identifier is used in a program statement
- ▶ **During the instantiation of a new object**
- ▶ During the construction of a new class
- ▶ At the beginning of any program execution

Question No: 24 (Marks: 1) - Please choose one

Consider the code below,

```
class Fred {  
public:  
Fred();  
...  
};  
int main()  
{  
Fred a[10];  
Fred* p = new Fred[10];  
...  
}
```

Select the best option,

▶ Fred a[10]; calls the default constructor 09 times

Fred* p = new Fred[10]; calls the default constructor 10 times

▶ **Produce an error**

▶ Fred a[10]; calls the default constructor 11 times

Fred* p = new Fred[10]; calls the default constructor 11 times

▶ Fred a[10]; calls the default constructor 10 times

Fred* p = new Fred[10]; calls the default constructor 10 times

Question No: 25 (Marks: 1) - Please choose one

Associativity can be changed in operator overloading.

▶ True

▶ **False**

Question No: 26 (Marks: 1) - Please choose one

A normal C++ operator that acts in special ways on newly defined data types is said to be

- ▶ glorified.
- ▶ encapsulated.
- ▶ **classified.**
- ▶ overloaded.

Question No: 27 (Marks: 1) - Please choose one

Which operator can not be overloaded?

- ▶ The relation operator (\geq)
- ▶ Assignment operator (=)
- ▶ Script operator ([])
- ▶ **Conditional operator (? :)**

Question No: 28 (Marks: 1) - Please choose one

Suppose obj1 and obj2 are two objects of a user defined class A. An + operator is overloaded to add obj1 and obj2 using the function call obj1+obj2.

Identify the correct function prototype against the given call?

- ▶ A operator + (A &obj);
- ▶ int + operator();
- ▶ **int operator (plus) ();**
- ▶ A operator(A &obj3);

Question No: 29 (Marks: 1) - Please choose one

Default constructor is such constructor which either has no -----or if it has some parameters these have ----- values

- ▶ Parameter, temporary
- ▶ Null, Parameter
- ▶ **Parameter, default**
- ▶ non of the given

Question No: 30 (Marks: 1) - Please choose one

Public methods of base class can ----- be accessed in its derived class

- ▶ directly
- ▶ **indirectly**
- ▶ simultaneously
- ▶ non of the given

Question No: 31 (Marks: 1)

Is **Deque** a Birectional Container?

Yes, deque behaves like queue (line) such that we can add elements on both sides of it.

Question No: 32 (Marks: 1)

What is meant by Generic Programming?

Generic programming refers to programs containing generic abstractions general code that is same in logic for all data types like printArray function), then we instantiate that generic program abstraction (function, class) for a particular data type, such abstractions can work with many different types of data.

Question No: 33 (Marks: 2)

Sort the following data in the order in which compiler searches a function?

Complete Specialization, Generic Template, Partial Specialization, Ordinary Function.

Specializations of this function template, instantiations with specific types, can be called just like an ordinary function:

```
cout << max(3, 7); // outputs 7
```

The compiler examines the arguments used to call max and determines that this is a call to max(int, int). It then instantiates a version of the function where the parameterizing type T is int, making the equivalent of the following function:

```
int max(int x, int y)
{
    return x < y ? y : x;
}
```

the C++ Standard Template Library contains the function template max(x, y) which creates functions that return either x or y, whichever is larger. max() could be defined like this:

```
template <typename T>
T max(T x, T y)
{
    return x < y ? y : x;
}
```

Question No: 34 (Marks: 2)

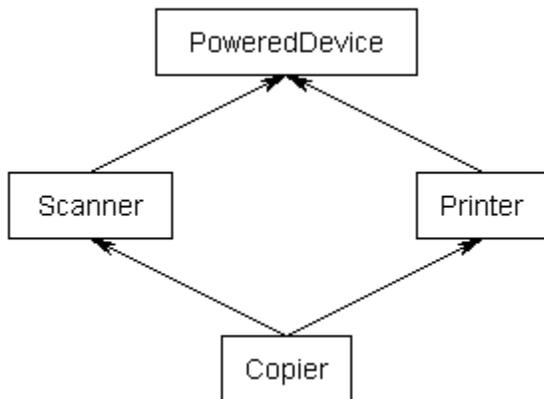

State any conflict that may rise due to multiple inheritance?

The conflict may arise is the diamond problem, which our author likes to call the “diamond of doom”. This occurs when a class multiply inherits from two classes

which each inherit from a single base class. This leads to a diamond shaped inheritance pattern.

For example, consider the following set of classes:

```
class PoweredDevice
{
};
class Scanner: public PoweredDevice
{
};
class Printer: public PoweredDevice
{
};
class Copier: public Scanner, public Printer
{
};
```

Scanners and printers are both powered devices, so they derived from PoweredDevice. However, a copy machine incorporates the functionality of both Scanners and Printers.

Ambiguity also cause problem.

Question No: 35 (Marks: 3)

Describe three properties necessary for a container to implement Generic Algorithms.

If you declare a container as holding pointers, you are responsible for managing the memory for the objects pointed to. The container classes will not automatically free memory for these objects when an item is erased from the container.

Container classes are expected to implement methods to do the following:

- create a new empty container (constructor),
- report the number of objects it stores (size),
- delete all the objects in the container (clear),
- insert new objects into the container,
- remove objects from it,
- provide access to the stored objects.

Question No: 36 (Marks: 3)

Write three important features of virtual functions.

With virtual functions, derived classes can provide new implementations of functions from their base classes. When someone calls a virtual function of an object of the derived class, this new implementation is called, even if the caller uses a pointer to the base class, and doesn't even know about the particular derived class.

The virtual function is an option, and the language defaults to non virtual, which is the fastest configuration.

The derived class can completely "override" the implementation or "augment" it (by explicitly calling the base class implementation in addition to the new things it does).

Question No: 37 (Marks: 3)

Consider the code below,

```
#include <iostream>
#include <stdlib.h>
using namespace std;
class Shape{
    public:
    void Draw(){cout<<"shape"<<endl;}
};
class Line : public Shape{
    public:
    void Draw(){cout<<"Line"<<endl;}
};
```

```
class Circle : public Shape{
    public:
    void Draw(){cout<<"Circle"<<endl;}
};

int main(int argc, char *argv[])
{
    Shape * ptr1 = new Shape();
    Shape * ptr2 = new Line();
    Shape * ptr3 = new Circle();

    ptr1->Draw();
    ptr2->Draw();
    ptr3->Draw();
    system("PAUSE");
    return 0;
}
```

This code shows output,

Shape

Shape

Shape

Give the reason for this output

Suppose we want to show the output,

Shape

Line

Circle

How we can change the code to do that?

```
class shape { public:
    void draw();
};
class circle : public shape { };
int main(int argc, char **argv){
    circle my_circle;
    my_circle.draw();
}
```

While this has all the usual advantages, e.g., code reuse, the real power of polymorphism comes into play when draw is declared to be virtual or pure virtual, as follows:

```
class shape{ public:
    virtual void draw()=0;
};
class circle : public shape { public:
    void draw();
}
```

Here, circle has declared its own draw function, which can define behavior appropriate for a circle. Similarly, we could define other classes derived from shape, which provide their own versions of draw. Now, because all the classes implement the shape interface, we can create collections of objects that can provide different behavior invoked in a consistent manner (calling the draw member

function). An example of this is shown here.

```

shape *shape_list[3]; // the array that will
                    // pointer to our shape objects
shape[0] = new shape; // three types of shapes
shape[1] = new line; // we have defined
shape[2] = new circle;
for(int i = 0; i < 3; i++){
    shape_list[i].draw();
}

```

When we invoke the draw function for each object on the list, we do not need to know anything about each object; C++ handles the details of invoking the correct version of draw. This is a very powerful technique, allowing us to provide extensibility in our designs. Now we can add new classes derived from shape to provide whatever behavior we desire. The key here is that we have separated the interface (the prototype for shape) from the implementation.

Question No: 38 (Marks: 5)

There are some errors in the code given below, you have to

4. Indicate the line no. with error/s
5. Give the reason for error/s
6. Correct the error/s.

```

25.#include <iostream>          this will be #include <iostream.h>
26.#include <stdlib.h>

```

```

27.using namespace std;
28.template <typename T>
29.class MyClass{
30.public:
31.MyClass(){
32.cout<<"This is class1"<<endl;

```

```
33.}
34.};
35.template <typename T>
36.class MyClass<int*>{
37.public:
38.MyClass(){
39.cout<<"This is class2"<<endl;
40.}
41.};
42.int main(int argc, char *argv[])
43.{
44.MyClass<int> c1;
45.MyClass<int*> c2;
46.system("PAUSE");
47.return 0;
48.}
```

Question No: 39 (Marks: 5)

Given are two classes A and B. class B is inherited from class A. Write a code snippet(for main function) that polymorphically call the method of class B. Also what changes do you suggest in the given code segment that are required to call the class B method polymorphically.

```
class A
{
public:
void method() { cout<<"A's method \n"; }

};
```

```
class B : public A
{

public:
void method() { cout<<"B's method\n"; }

};
```

Ans:

```
public class Test
{
public class A {}

public class B extends A {}

private void test(A a)
{
System.out.println("test(A)");
}

private void test(B b)
{
System.out.println("test(B)");
}

public static void main(String[] args)
```

```

{
Test t = new Test();
A a = t.new A();
A b = t.new B();

t.test(a);
t.test(b);
}
}

```

Question No: 40 (Marks: 10)

Create built-in STL (Standard Template Library) **vector class object** for **strings** and add in it some words by taking input from user, then apply the `sort()` algorithm to array of words stored in this vector class object.

Hint: Use `push_back()` to add the words in vector class object, and the `[]` operator and `size()` to display these sorted words.

The STL is the containers, iterators and algorithms component of the proposed C++ Standard Library [ANSI95]. It represents a novel application of principles which have their roots in styles of programming other than Object-orientation.

```
void listWords(istream& in, ostream& out)
```

```

{
    string s;

    while (!in.eof() && in >> s) {
        add s to some container
    }

    sort the strings in the container
    remove the duplicates
}

```

```

    for (each string t in container) {
        out << t;
    }
}

```

For now, assume that a word is defined as a whitespace-separated string as delivered by the stream extraction operator. Later on we will consider ways of refining this definition.

Given the way this problem is expressed, we can implement this program directly, if naïvely. The STL container class `vector` will suffice to hold the words: applying the algorithms `sort` and `unique` provides the required result.

```

void listWords(istream& in, ostream& out)
{
    string s;
    vector<string> v;

    while (!in.eof() && in >> s)
        v.push_back(s);           // (1)

    sort(v.begin(), v.end());

    vector<string>::iterator e
        = unique(v.begin(), v.end()); // (2)

    for (vector<string>::iterator b = v.begin();
         b != e;
         b++) {
        out << *b << endl;
    }
}

```

At (1) the vector member function `push_back()` is used to add to the end of the vector. This can also be done using the `insert` member, which takes as a parameter an iterator identifying the position in the vector at which to place the added element:

```

    v.insert(v.end(), s);

```

This allows us to add at any position in the vector. Be aware, though, that adding anywhere other than the end implies the overhead of physically shifting all elements from the insertion point to the end to make room for the new value. For this reason, and given the choices made in this example, attempts to optimise this code by maintaining the vector in sorted order are unwise. Replace `vector` with `list`

and this becomes possible - although in both cases a search over the container will be necessary to determine the correct position of insertion.

The unique algorithm has the surprising property of not changing the length of the container to which it is applied (it can hardly do this, as it has access not to the underlying container, but only to the pair of iterators it is passed). Instead, it guarantees that duplicates are removed by moving unique entries towards the beginning of the container, returning an iterator indicating the new end of the container. This can be used directly (as here, at (2)), conversely it can be passed to the erase member with the old end iterator, to truncate the container.

Question No: 41 (Marks: 10)

Q.

Write a detailed note on Exceptions in Destructors with the help of a coding example.

Exceptions in Destructors:

An object is presumably created to do something. Some of the changes made by an object should persist after an object dies (is destructed) and some changes should not. Take an object implementing a SQL query. If a database field is updated via the SQL object then that change should persist after the SQL objects dies. To do its work the SQL object probably created a database connection and allocated a bunch of memory. When the SQL object dies we want to close the database connection and deallocate the memory, otherwise if a lot of SQL objects are created we will run out of database connections and/or memory.

The logic might look like:

```
Sql::~Sql()
{
    delete connection;
    delete buffer;
}
```

Let's say an exception is thrown while deleting the database connection. Will the buffer be deleted? No. Exceptions are basically non-local gotos with stack cleanup. The code for deleting the buffer will never be executed creating a gaping resource leak.

Special care must be taken to catch exceptions which may occur during object destruction. Special care must also be taken to fully destruct an object when it throws an exception.

Example code for exception

```
#include<iostream.h>
#include<conio.c>
class Exception {
private:

    char message[30] ;
public:

    Exception() {strcpy(message,"There is not enough stock");}
    char * get_message() { return message; }
};
class Item {
private:

    int stock ;
    int required_quantity;
public:

    Item(int stk, int qty)
    {
        stock = stk;
        required_quantity = qty;
    }
    int get_stock()
    {
        return stock;
    }
};
```

```
int get_required_quantity()
{
    return required_quantity;
}

void order()
{
    if (get_stock() < get_required_quantity())

        throw Exception();
    else
        cout << "The required quantity of item is available in the stock";
}

~Item(){}
};

void main()
{

    Item obj(10, 20);

    try
    {
        obj.order();
    }
    catch(Exception & exp2)
    {
        getch();
        cout << "Exception: " << exp2.get_message() << endl;
    }
    getch();
}
```

CS304 TODAYS QUIZ BY SHAZIA 24-11-2010

Class is not a mechanism to create objects and define user data types.

true

false

Memory is allocated to non static members only, when:

Object is created

The sub-object's life is not dependent on the life of master class in _____.

Aggregation

Unary operators and assignment operator are right associative.

true

The \geq operator can't be overloaded.

false

_____ is creating objects of one class inside another class.

Composition

If we are create array of objects through new operator, then

None of the given

Object can be declared constant with the use of Constant keyword.

false

_____ Operator will take only one operand.

none of the given

Which of the following operator(s) take(s) one or no argument if overloaded?

All of the given choices

this pointer does not pass implicitly to _____ functions.

Static Member

Operator overloading is

giving C++ operators more than they can handle.

Date: 08-11-2010

Question # 1 of 10

Information hiding can be achieved through_____.

Encapsulation, Abstraction

Question # 2 of 10 (Start time: 01:11:21 AM) Total Marks: 1

A good model is related to a real life problem.

Select correct option:

Closely

Question # 3 of 10 (Start time: 01:12:33 AM) Total Marks: 1

Which of the following features of OOP is used to derive a class from another?

Select correct option:

Inheritance

CS304 - Object Oriented Programming

****QUESTION:** What is OOP?

****ANSWER:** The object oriented programming is commonly known as OOP. Most of the languages are developed using OOP concept. Object-oriented programming (OOP) is a programming concept that uses "objects" to develop a system. An object hides the implementation details and exposes only the functionalities and parameters it requires to its client. Here also an object shares the same concept as that of a bike. While driving a motor bike, we are unaware of its implementation details such as how it is developed, internal working of gears etc.? We know only the functions or actions it can perform.

****QUESTION:** What are the various elements of OOP?

****ANSWER:** Various elements of OOP are: Object Class Method Encapsulation Information Hiding Inheritance Polymorphism

****QUESTION:** What are the characteristics of Object Oriented programming language?

****ANSWER:** Some key features of the Object Oriented programming are: Emphasis on data rather than procedure Programs are divided into entities known as objects Data Structures are designed such that they characterize objects Functions that operate on data of an object are tied together in data structures Data is hidden and cannot be accessed by external functions Objects communicate with each other through functions New data and functions can be easily added whenever necessary Follows bottom up design in program design

****QUESTION:** What are the basic Concepts used in the Object-Oriented Programming language?

****ANSWER:** Object Class Data Abstraction and Encapsulation Polymorphism
Inheritance Message passing Dynamic binding

****QUESTION:** What Is An Object? (Object-Oriented Technology)

****ANSWER:** There are many definitions of an object, such as found in [Booch 91, p77]: "An object has state, behavior, and identity; the structure and behavior of similar objects are defined in their common class; the terms instance and object are interchangeable". This is a "classical languages" definition, as defined in [Coplien 92, p280], where "classes play a central role in the object model", since they do not in prototyping/delegation languages. "The term object was first formally applied in the Simula language, and objects typically existed in Simula programs to simulate some aspect of reality" [Booch 91, p77]. Other definitions referenced by Booch include Smith and Tockey: "an object represents an individual, identifiable item, unit, or entity, either real or abstract, with a well-defined role in the problem domain." and [Cox 91]: "anything with a crisply defined boundary" (in context, this is "outside the computer domain". A more conventional definition appears on pg 54). Booch goes on to describe these definitions in depth. [Martin 92, p 241] defines: "An "object" is anything to which a concept applies", and "A concept is an idea or notion we share that applies to certain objects in our awareness". [Rumbaugh 91] defines: "We define an object as a concept, abstraction or thing with crisp boundaries and meaning for the problem at hand." [Shlaer 88, p 14] defines: "An object is an abstraction of a set of real-world things such that:

****QUESTION:** What Is Object Encapsulation (Or Protection)?

****ANSWER:** [Booch 91, p. 45] defines: "Encapsulation is the process of hiding all of the details of an object that do not contribute to its essential characteristics." [Coad 91, 1.1.2] defines: "Encapsulation (Information Hiding). A principle, used when developing an overall program structure, that each component of a program should encapsulate or hide a single design decision... The interface to each module is defined in such a way as to reveal as little as possible about its inner workings. [Oxford, 1986]" Some languages permit arbitrary access to objects and allow methods to be defined outside of a class as in conventional programming. Simula and Object Pascal provide no protection for objects, meaning instance variables may be accessed wherever visible. CLOS and Ada allow methods to be defined outside of a class, providing functions and procedures. While both CLOS and Ada have packages for encapsulation, CLOS's are optional while Ada's methodology clearly specifies class-like encapsulation (Adts). However most object-oriented languages provide a well defined interface to their objects thru classes. C++ has a very general encapsulation/protection mechanism with public, private and protected members. Public members (member data and member functions) may be accessed from anywhere. A Stack's Push and Pop methods will be public. Private members are only accessible from within a class. A Stack's representation, such as a list or array, will usually be private. Protected members are accessible from within a class and also from within subclasses (also called derived classes). A Stack's representation could be declared protected allowing subclass access. C++ also allows a class to specify friends (other (sub)classes and functions), that can access all members (its representation). Eiffel 3.0 allows exporting access to specific classes.

****QUESTION:** What Is A Class?

****ANSWER:** A class is a general term denoting classification and also has a new meaning in object-oriented methods. Within the OO context, a class is a specification of structure (instance variables), behavior (methods), and inheritance (parents, or recursive structure and behavior) for objects. As pointed out above, classes can also specify access permissions for clients and derived classes, visibility and member lookup resolution. This is a feature-based or intensional definition, emphasizing a class as a descriptor/constructor of objects (as opposed to a collection of objects, as with the more classical extensional view, which may begin the analysis process). Original Aristotlean classification defines a "class" as a generalization of objects: [Booch 91, p93] "a group, set, or kind marked by common attributes or a common attribute; a group division, distinction, or rating based on quality, degree of competence, or condition".

****QUESTION:** What Is A Meta-Class?

****ANSWER:** Meta-Class is a class' class. If a class is an object, then that object must have a class (in classical OO anyway). Compilers provide an easy way to picture Meta-Classes. Classes must be implemented in some way; perhaps with dictionaries for methods, instances, and parents and methods to perform all the work of being a class. This can be declared in a class named "Meta-Class". The Meta-Class can also provide services to application programs, such as returning a set of all methods, instances or parents for review (or even modification). [Booch 91, p 119] provides another example in Smalltalk with timers. In Smalltalk, the situation is more complex

****QUESTION:** What Is Inheritance?

****ANSWER:** Inheritance provides a natural classification for kinds of objects and allows for the commonality of objects to be explicitly taken advantage of in modeling and constructing object systems. Natural means we use concepts, classification, and generalization to understand and deal with the complexities of the real world. See the example below using computers. Inheritance is a relationship between classes where one class is the parent base/superclass/ancestor/etc.) class of another. Inheritance provides programming by extension (as opposed to programming by reinvention [LaLonde 90]) and can be used as an is-a-kind-of (or is-a) relationship or for differential programming. Inheritance can also double for assignment

****QUESTION:** What Is The Difference Between Object-Based And Object-Oriented?

****ANSWER:** Object-Based Programming usually refers to objects without inheritance [Cardelli 85] and hence without polymorphism, as in '83 Ada and Modula-2. These languages support abstract data types (Adts) and not classes, which provide inheritance and polymorphism. Ada95 and Modula-3; however, support both inheritance and polymorphism and are object-oriented. [Cardelli 85, p481] state "that a language is object-oriented if and only if it satisfies the following requirements: - It supports objects that are data abstractions with an interface of named operations and a hidden local state. - Objects have an associated type. - Types may inherit attributes from supertypes. object-oriented = data abstractions + object types + type inheritance These definitions are also

found in [Booch 91, Ch2 and Wegner 87]. [Coad 91] provides another model: Object-Oriented = Classes and Objects + Inheritance + Communication with messages

****QUESTION:** What is Abstraction?

****ANSWER:** The importance of abstraction is derived from its ability to hide irrelevant details and from the use of names to reference objects. Abstraction is essential in the construction of programs. It places the emphasis on what an object is or does rather than how it is represented or how it works. Thus, it is the primary means of managing complexity in large programs.

****QUESTION:** What is a Class Diagram?

****ANSWER:** A class diagrams are widely used to describe the types of objects in a system and their relationships. Class diagrams model class structure and contents using design elements such as classes, packages and objects.

****QUESTION:** What is Method Overriding?

****ANSWER:** Method overriding is a language feature that allows a subclass to override a specific implementation of a method that is already provided by one of its super-classes. A subclass can give its own definition of methods but need to have the same signature as the method in its super-class. This means that when overriding a method the subclass's method has to have the same name and parameter list as the super-class's overridden method.

****QUESTION:** What is Operator Overloading?

****ANSWER:** The operator overloading is a specific case of polymorphisms in which some or all of operators like +, - or == are treated as polymorphic (multi) functions and as such have different behaviors depending on the types of its arguments.

****QUESTION:** What is Method Overloading?

****ANSWER:** The method overloading is the ability to define several methods (in same class) all with the same name but different on the basis of i) number of parameters ii) types of parameters.

****QUESTION:** What is Polymorphisms?

****ANSWER:** Polymorphism is a generic term that means 'many shapes'. More precisely Polymorphism means the ability to request that the same operations be performed by a wide range of different types of things.

****QUESTION:** What is Inheritance?

****ANSWER:** Ability of a new class to be created, from an existing class by extending it, is called inheritance.

****QUESTION:** What is a base class?

****ANSWER:** When inheritance is used to create a new class from another, the new class is called the subclass or derived class, and the class from which it was derived is called the base class.

****QUESTION:** What is a concrete class?

****ANSWER:** A concrete class is one that can be used to directly create, or instantiate objects, unlike an abstract base class which can only be used as a base class for other classes which eventually lead to concrete classes

****QUESTION:** What are data members?

****ANSWER:** Objects are miniature programs, consisting of both code and data. The code consists of a series of member functions. The data items are called data members.

****QUESTION:** What is a constructor?

****ANSWER:** Objects are complete, miniature programs and, like any good programs, have well defined initialization and termination phases. They have special routines (i.e. member functions) to look after this. The initialization routine is called the constructor, and C++ ensures that every object is properly initialized by calling its constructor. The designer of the object can have more than one constructor, a situation called overloading and then the compiler will select between them depending on exactly what arguments are passed to the constructor function. However there must always be a default constructor, to be used when no information is supplied.

****QUESTION:** What is a destructor?

****ANSWER:** The termination routine is called the destructor, and C++ will provide a default if none is supplied. If, during the lifetime of the object, it uses heap memory then the designer of the object must provide a destructor function to release such memory to avoid a memory leak.

****QUESTION:** What is global variable?

****ANSWER:** Global variables can be accessed throughout a program. Another way to put this is to say they have global scope.

****QUESTION:** What is local variable?

****ANSWER:** Local variables can only be accessed within the function, or more specifically the compound statement in which they are declared. Another way to put this is to say they have local scope.

****QUESTION:** What is a null pointer?

****ANSWER:** A null pointer is a pointer that is currently pointing to nothing. Often pointers are set to zero to make them null pointers or tested against zero to see if they are null or not.

****QUESTION:** What is a pointer?

****ANSWER:** A pointer is a variable that holds the address of another variable or object.

****QUESTION:** What is meant by protected?

****ANSWER:** The protected keyword in the class statement means that the following members of the class are not available to users of the objects of the class, but can be used by any subclass that inherits from it, and consequently forms part of its implementation.

1. **Abstract class :** A class that can only be used as a base class for some other class. A class is abstract if it has at least one pure virtual function.
2. **Access control :** A C++ mechanism for prohibiting or granting access to individual members of a class. See public, private, protected, and visibility.
3. **Access declaration :** A way of controlling access to a specified member of a base class when it is used in a derived class.
4. **Access specifier :** A way of labelling members of a class to specify what access is permitted i.e public, private, and protected.
5. **accessor :** : A public member subprogram that provides query access to a private data member.
6. **agent: :** An object that can both initiate behavior in other objects, as well as be operated upon by other objects.
7. **Allocation :** The process of giving memory space to an object. See dynamic storage,static storage, and deallocation.
8. **ANSI :** Acronym for American National Standards Institute, a standards body currently standardizing C++.
9. **array : :** An ordered collection that is indexed.
10. **array constructor: :** A means of creating a part of an array by a single statement.
11. **array overflow: :** An attempt to access an array element with a subscript outside the array size bounds.
12. **array pointer: :** A pointer whose target is an array, or an array section.
13. **array section: :** A subobject that is an array and is not a defined type component.
14. **assertion: :** A programming means to cope with errors and exceptions.

15. assignment operator: : The equal symbol, “=”, which may be overloaded by a user.
16. attribute: : A property of a variable that may be specified in a type declaration statement.
17. base class: : A previously defined class whose public members can be inherited by another class. (Also called a super class.)
18. behavior sharing: : A form of polymorphism, when multiple entities have the same generic interface. This is achieved by inheritance or operator overloading.
19. binary operator: : An operator that takes two operands.
20. bintree: : A tree structure where each node has two child nodes.
21. call-by-reference: : A language mechanism that supplies an argument to a procedure by passing the address of the argument rather than its value. If it is modified, the new value will also take effect outside of the procedure.
22. call-by-value: : A language mechanism that supplies an argument to a procedure by passing a copy of its data value. If it is modified, the new value will not take effect outside of the procedure that modifies it.
23. class attribute: : An attribute whose value is common to a class of objects rather than a value peculiar to each instance of the class.
24. class descriptor: : An object representing a class, containing a list of its attributes and methods as well as the values of any class attributes.
25. class diagram: : A diagram depicting classes, their internal structure and operations, and the fixed relationships between them.
26. class inheritance: : Defining a new derived class in terms of one or more base classes.
27. class: : An abstraction of an object that specifies the static and behavioral characteristics of it, including their public and private nature. A class is an ADT with a constructor template from which object instances are created.
28. concrete class: : A class having no abstract operations and can be instantiated.
29. constructor: : An operation, by a class member function, that initializes a newly created instance of a class.

30. container class: : A class whose instances are container objects. Examples include sets, arrays, and stacks.
31. container object: : An object that stores a collection of other objects and provides operations to access or iterate over them.
32. data hiding: : The concept that some variables and/or operations in a module may not be accessible to a user of that module; a key element of data abstraction.
33. information hiding: : The principle that the state and implementation of an object should be private to that object and only accessible via its public interface.
34. inheritance: : The relationship between classes whereby one class inherits part or all of the public description of another base class, and instances inherit all the properties and methods of the classes which they contain.
35. instance: : A individual example of a class invoked via a class constructor.
36. instantiation: : The process of creating (giving a value to) instances from classes.
37. interaction diagram: : A diagram that shows the flow of requests, or messages between objects.
38. interface: : The set of all signatures (public methods) defined for an object.
39. intrinsic constructor: : A class member function with the same name as the class which receives initial values of all the data members as arguments.
40. Is-A: : A relationship in which the derived class is a variation of the base class.
41. linked list: : A data structure in which each element identifies its predecessor and/or successor by some form of pointer.
42. member data: : Variables declared as components of a defined type and encapsulated in a class.
43. member function: : Subprograms encapsulated as members of a class.
44. message passing: : The philosophy that objects only interact by sending messages to each other that request some operations to be performed.
45. message: : A request, from another object, for an object to carry out one of its operations.
46. method: : A class member function encapsulated with its class data members.

47. object : : A concept, or thing with crisp boundaries and meanings for the problem at hand; an instance of a class.
48. object diagram: : A graphical representation of an object model showing relationships, attributes, and operations.
49. object-oriented (OO): : A software development strategy that organizes software as a collection of objects that contain both data structure and behavior.
50. object-oriented programming (OOP) : Object-oriented programs are object-based, class-based, support inheritance between classes and base classes and allow objects to send and receive messages.
51. operation: : Manipulation of an object's data by its member function when it receives a request.
52. operator overloading: : A special case of polymorphism; attaching more than one meaning to the same operator symbol. 'Overloading' is also sometimes used to indicate using the same name for different objects.
53. overloading: : Using the same name for multiple functions or operators in a single scope.
54. overriding: : The ability to change the definition of an inherited method or attribute in a subclass.
55. parameterized classes: : A template for creating real classes that may differ in well-defined ways as specified by parameters at the time of creation. The parameters are often data types or classes, but may include other attributes, such as the size of a collection. (Also called generic classes.)
56. pointer: : A single data object which stands such as an array, or defined type.
57. polymorphism: : The ability of an function/operator, with one name, to refer to arguments, or return types, of different classes at run time.
58. private: : That part of an class, methods or attributes, which may not be accessed by other classes, only by instances of that class.
59. protected: : (Referring to an attribute or operation of a class in C++) accessible by methods of any descendent of the current class.
60. public: : That part of an object, methods or attributes, which may be accessed by other objects, and thus constitutes its interface.
61. super class: : A class from which another class inherits.

FINALTERM EXAMINATION

CS304- Object Oriented Programming (Session - 4)

Question No: 1 (Marks: 1) - Please choose one

Classes like TwoDimensionalShape and ThreeDimensionalShape would normally be concrete, while classes like Sphere and Cube would normally be abstract.

- ▶ True
- ▶ False

Question No: 2 (Marks: 1) - Please choose one

Virtual functions allow you to

- ▶ create an array of type pointer-to-base class that can hold pointers to derived classes.
- ▶ create functions that can never be accessed.
- ▶ group objects of different classes so they can all be accessed by the same function code.
- ▶ use the same function call to execute member functions of objects from different classes

Question No: 3 (Marks: 1) - Please choose one

A pointer to a base class can point to objects of a derived class.

- ▶ True
- ▶ False

Question No: 4 (Marks: 1) - Please choose one

A copy constructor is invoked when

- ▶ a function do not returns by value.
- ▶ an argument is passed by value.

- ▶ a function returns by reference.
- ▶ an argument is passed by reference.

Question No: 5 (Marks: 1) - Please choose one

Each try block can have _____ no. of catch blocks.

- ▶ 1
- ▶ 2
- ▶ 3
- ▶ As many as necessary.

Question No: 6 (Marks: 1) - Please choose one

Non Template Friend functions of a class are friends of _____ instance/s of that class.

- ▶ All
- ▶ One specific
- ▶ All instances of one date type
- ▶ None of the given options

Question No: 7 (Marks: 1) - Please choose one

Template functions use _____ than ordinary functions.

- ▶ Greater Memory
- ▶ Lesser Memory
- ▶ Equal Memory
- ▶ None of the given options

Question No: 8 (Marks: 1) - Please choose one

The find() algorithm

- ▶ finds matching sequences of elements in two containers.
- ▶ finds a container that matches a specified container.
- ▶ takes iterators as its first two arguments.
- ▶ takes container elements as its first two arguments.

Question No: 9 (Marks: 1) - Please choose one

The copy() algorithm returns an iterator to

- ▶ the last element copied from.
- ▶ the last element copied to.
- ▶ the element one past the last element copied from.
- ▶ the element one past the last element copied to.

Question No: 10 (Marks: 1) - Please choose one

If you define a vector v with the default constructor, and define another vector w with a one-argument constructor to a size of 11, and insert 3 elements into each of these vectors with push_back(), then the size() member function will return _____ for v and _____ for w.

- ▶ 11 for v and 3 for w.

- ▶ 0 for v and 0 for w.
- ▶ 0 for v and 3 for w.
- ▶ 3 for v and 11 for w.

Question No: 11 (Marks: 1) - Please choose one

Which is not the Advantage of inheritance?

- ▶ providing class growth through natural selection.
- ▶ facilitating class libraries.
- ▶ avoiding the rewriting of code.
- ▶ providing a useful conceptual framework.

Question No: 12 (Marks: 1) - Please choose one

```
class DocElement
{
public:
    virtual void Print() { cout << "Generic element"; }
};
class Heading : public DocElement
{
public:
    void Print() { cout << "Heading element"; }
};
```

```
class Paragraph : public DocElement
{
public:
    void Print() { cout << "Paragraph element"; }
};
void main()
{
    DocElement * p = new Paragraph();

    p->Print();
}
```

When you run this program, it will print out a single line to the console output.

What will be in that line?

Select one correct answer from the following list:

- ▶ Generic element
- ▶ Heading element
- ▶ Paragraph element
- ▶ Nothing will be printed.

Question No: 13 (Marks: 1) - Please choose one

Which type of inheritance is being represented by the following statement,
class X : public A, public B { };

- ▶ Single inheritance
- ▶ Multiple inheritance
- ▶ Double inheritance
- ▶ None of the given options

Question No: 14 (Marks: 1) - Please choose one

When we write a class template the first line must be:

- ▶ `template < class class_name>`
- ▶ `template < class data_type>`
- ▶ `template < class T >`

Here T can be replaced with any name but it is preferable.

- ▶ `class class-name()`
- `class template<class_name>`

Question No: 15 (Marks: 1) - Please choose one

Function templates should be used where code and behavior must be identical.

- ▶ True
- ▶ False

Question No: 16 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

- ▶ Reusability
- ▶ Writability
- ▶ Maintainability
- ▶ All of given

Question No: 17 (Marks: 1) - Please choose one

The specialization pattern `<T*>` after the name says that this specialization is to be used for every,

- ▶ data type
- ▶ meta type

- ▶ virtual type

- ▶ pointer type

Question No: 18 (Marks: 1) - Please choose one

A range is often supplied to an algorithm by two _____ values.

- ▶ italic
- ▶ iteration
- ▶ iterator
- ▶ None of given

Question No: 19 (Marks: 1) - Please choose one

Which of the following is an integral part of an object?

- ▶ State
- ▶ Behavior
- ▶ Unique identity
- ▶ All of the given

Question No: 20 (Marks: 1) - Please choose one

Consider the following statement

Cupboard has books

What is the relationship between Cupboard and books?

- ▶ Composition
- ▶ Aggregation
- ▶ Inheritance
- ▶ None of the given options

Question No: 21 (Marks: 1) - Please choose one

Which sentence clearly defines an object?

- ▶ one instance of a class.
- ▶ another word for a class.
- ▶ a class with static methods.
- ▶ a method that accesses class attributes.

Question No: 22 (Marks: 1) - Please choose one

_____, which means if A declares B as its friend it does NOT mean that A can access private data of B. It only means that B can access all data of A.

- ▶ Friendship is one way only
- ▶ Friendship is two way only
- ▶ NO Friendship between classes
- ▶ Any kind of friendship

Question No: 23 (Marks: 1) - Please choose one

The statement `objA=objB;` will cause a compiler error if the objects are of different classes.

- ▶ True
- ▶ False

Question No: 24 (Marks: 1) - Please choose one

Consider the call given below of an overloaded operator "+",

Rational_number_1 + Rational_number_2

Where `Rational_number_1` and `Rational_number_2` are the two objects of `Rational_number` class (a user defined class). Identify which of the above two objects will be passed as an argument to the overloaded operator function?

- ▶ Rational_number_1
- ▶ Rational_number_2
- ▶ Both Rational_number_1 & Rational_number_2
- ▶ any of the two objects, randomly

Question No: 25 (Marks: 1) - Please choose one

If a class D has been derived using protected inheritance from class B (If B is a protected base and D is derived class) then public and protected members of B ----- accessed by member functions and friends of class D and classes derived from D

- ▶ can be
- ▶ cannot be
- ▶ does restrict to be
- ▶ not given

Question No: 26 (Marks: 1) - Please choose one

In Private ----- only member functions and friend classes or functions of a derived class can convert pointer or reference of derived object to that of parent object

- ▶ specialization
- ▶ inheritance
- ▶ abstraction
- ▶ composition

Question No: 27 (Marks: 2)

Give two uses of a destructor.

Question No: 28 (Marks: 2)

Describe the way to declare a template class as a friend class of any other class.

Question No: 29 (Marks: 2)

Give the name of two basic types of containers collectively called First class containers?

Question No: 30 (Marks: 2)

State any conflict that may rise due to multiple inheritance?

Question No: 31 (Marks: 3)

What will be the output after executing the following code?

```
class c1{
public:
virtual void function(){
cout<<"I am in c1"<<endl;
```

```

}

};
class c2: public c1 {
public:
void function(){
cout<<"I am in c2"<<endl;

}

};
class c3: public c1 {
public:
void function(){
cout<<"I am in c3"<<endl;
}

};

int main(){

c1 * test1 = new c2();
c1 * test2 = new c3();
test1->function();
test2->function();
system("PAUSE");
return 0;
}

```

Question No: 32 (Marks: 3)

If we declare a function as friend of a template class will it be a friend for a particular data type or for all data types of that class.

Question No: 33 (Marks: 3)

Tell the logical error/s in the code given below with reference to resource management; also describe how we can correct that error/s.

```

class Test{

public:
int function1(){
    try{

```

```

        FILE *fileptr = fopen("filename.txt","w");
        throw exception();
        fclose(fileptr);
        return 0;
    }
    catch(Exception e){
        ...
    }
}
};

```

Question No: 34 (Marks: 5)

What is the output produced by the following program?

```

#include<iostream.h>

void sample_function(double test) throw (int);

int main()
{
    try
    {
        cout <<"Trying.\n";
        sample_function(98.6);
        cout << "Trying after call.\n";
    }
    catch(int)
    {
        cout << "Catching.\n";
    }

    cout << "End program.\n";
    return 0;
}

void sample_function(double test) throw (int)
{
    cout << "Starting sample_function.\n";
    if(test < 100)
        throw 42;
}

```

Question No: 35 (Marks: 5)

The code given below has one template function as a friend of a template class,

1. You have to identify any error/s in this code and describe the reason for error/s.
2. Give the correct code after removing the error/s.

```

template<typename U>
void Test(U);
template< class T >

class B {
    int data;
    public:
    friend void Test<>( T );
};

template<typename U>
void Test(U u){
    B < int> b1;
    b1.data = 7;
}
int main(int argc, char *argv[])
{
    char i;
    Test(i);
    system("PAUSE");
    return 0;
}

```

Question No: 36 (Marks: 5)

Consider the following class,

```

class Base
{
    char * p;
public:
    Base() { p = new char[10]; }

    ~Base() { delete [] p; }
};
class Derived : public Base
{
    char * q;
public:
    Derived() { q = new char[20]; }

    ~Derived() { delete [] q; }
};
void foo()
{
    Base* p = new Derived();
}

```

```
    delete p;  
}
```

With this program, every time function foo is called, some memory will leak.
Explain why memory will leak. Also, explain how to fix this problem.

FINALTERM EXAMINATION
Fall 2009
CS304- Object Oriented Programming (Session - 1)

Time: 120 min
Marks: 75

Question No: 1 (Marks: 1) - Please choose one

Which one of the following terms must relate to **polymorphism**?

- ▶ Static allocation
- ▶ Static typing
- ▶ **Dynamic binding**
- ▶ Dynamic allocation

Question No: 2 (Marks: 1) - Please choose one

Multiple inheritance can be of type

- ▶ Public
- ▶ Private

- ▶ Protected
- ▶ **All of the given**

Question No: 3 (Marks: 1) - Please choose one

When a subclass specifies an alternative definition for an attribute or method of its superclass, it is _____ the definition in the superclass.

- ▶ overload
- ▶ **overriding**
- ▶ copy riding
- ▶ none of given

Question No: 4 (Marks: 1) - Please choose one

Like template functions, a class template may not handle all the types successfully.

- ▶ **True**
- ▶ False

Question No: 5 (Marks: 1) - Please choose one

It is sometimes useful to specify a class from which no objects will ever be created.

- ▶ True
- ▶ **False**

Question No: 6 (Marks: 1) - Please choose one

Assume a class Derv that is privately derived from class Base. An object of class Derv located in main() can access

- ▶ public members of Derv.
- ▶ protected members of Derv.

- ▶ private members of Derv.
- ▶ **protected members of Base.**

Question No: 7 (Marks: 1) - Please choose one

A pointer to a base class can point to objects of a derived class.

- ▶ **True**
- ▶ False

Question No: 8 (Marks: 1) - Please choose one

A copy constructor is invoked when

- ▶ a function do not returns by value.
- ▶ an argument is passed by value.
- ▶ **a function returns by reference.**
- ▶ an argument is passed by reference.

Question No: 9 (Marks: 1) - Please choose one

A function call is resolved at run-time in _____

- ▶ non-virtual member function.
- ▶ **virtual member function.**
- ▶ Both non-virtual member and virtual member function.
- ▶ None of given

Question No: 10 (Marks: 1) - Please choose one

When the base class and the derived class have a member function with the same name, you must be more specific which function you want to call (using _____).

▶ **scope resolution operator**

▶ dot operator

▶ null operator

▶ Operator overloading

Question No: 11 (Marks: 1) - Please choose one

Each try block can have _____ no. of catch blocks.

▶ 1

▶ 2

▶ 3

▶ **As many as necessary.**

Question No: 12 (Marks: 1) - Please choose one

Two important STL associative containers are _____ and _____.

▶ set,map

▶ **sequence,mapping**

▶ setmet,multipule

▶ sit,mat

Question No: 13 (Marks: 1) - Please choose one

The mechanism of selecting function at run time according to the nature of calling object is called,

▶ late binding

▶ static binding

▶ virtual binding

▶ **None of the given options**

Question No: 14 (Marks: 1) - Please choose one

An abstract class is useful when,

- ▶ We do not derive any class from it.
- ▶ There are multiple paths from one derived class to another.
- ▶ **We do not want to instantiate its object.**
- ▶ You want to defer the declaration of the class.

Question No: 15 (Marks: 1) - Please choose one

Which of the following is incorrect line regarding function template?

- ▶ `template<class T>`
- ▶ `template <typename U>`
- ▶ **`Class<template T>`**
- ▶ `template < class T, class U>`

Question No: 16 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

- ▶ Reusability
- ▶ Writability
- ▶ Maintainability
- ▶ **All of given**

Question No: 17 (Marks: 1) - Please choose one

By default the vector data items are initialized to _____

- ▶ **0**
- ▶ 0.0
- ▶ 1
- ▶ null

Question No: 18 (Marks: 1) - Please choose one

Which one of the following functions returns the total number of elements in a vector.

- ▶ length();
- ▶ **size();**
- ▶ ele();
- ▶ veclen();

Question No: 19 (Marks: 1) - Please choose one

Suppose you create an uninitialized vector as follows:

```
vector<int> evec;
```

After adding the statment,

```
evec.push_back(21);
```

what will happen?

- ▶ The following statement will add an element to the start (the back) of evec and will initialize it with the value 21.
- ▶ The following statement will add an element to the center of evec and will reinitialize it with the value 21.
- ▶ The following statement will delete an element to the end (the back) of evec and will reinitialize it with the value 21.
- ▶ **The following statement will add an element to the end (the back) of evec and initialize it with the value 21.**

Question No: 20 (Marks: 1) - Please choose one

An STL container can not be used to,

- ▶ hold objects of class employee.
- ▶ store elements in a way that makes them quickly accessible.
- ▶ **compile c++ programs.**
- ▶ organize the way objects are stored in memory

Question No: 21 (Marks: 1) - Please choose one

Algorithms can only be implemented using STL containers.

- ▶ True
- ▶ **False**

Question No: 22 (Marks: 1) - Please choose one

The main function of scope resolution operator (::) is,

▶ **To define an object**

- ▶ To define a data member
- ▶ To link the definition of an identifier to its declaration
- ▶ To make a class private

Question No: 23 (Marks: 1) - Please choose one

When is a constructor called?

- ▶ Each time the constructor identifier is used in a program statement
- ▶ **During the instantiation of a new object**
- ▶ During the construction of a new class
- ▶ At the beginning of any program execution

Question No: 24 (Marks: 1) - Please choose one

Consider the code below,

```
class Fred {  
public:  
Fred();  
...  
};  
int main()  
{  
Fred a[10];  
Fred* p = new Fred[10];  
...  
}
```

Select the best option,

- ▶ Fred a[10]; calls the default constructor 09 times
Fred* p = new Fred[10]; calls the default constructor 10 times

▶ **Produce an error**

- ▶ Fred a[10]; calls the default constructor 11 times
Fred* p = new Fred[10]; calls the default constructor 11 times

- ▶ Fred a[10]; calls the default constructor 10 times
Fred* p = new Fred[10]; calls the default constructor 10 times

Question No: 25 (Marks: 1) - Please choose one

Associativity can be changed in operator overloading.

- ▶ True
- ▶ **False**

Question No: 26 (Marks: 1) - Please choose one

A normal C++ operator that acts in special ways on newly defined data types is said to be

- ▶ glorified.
- ▶ encapsulated.
- ▶ **classified.**
- ▶ overloaded.

Question No: 27 (Marks: 1) - Please choose one

Which operator can not be overloaded?

- ▶ The relation operator (>=)
- ▶ Assignment operator (=)
- ▶ Script operator ([])
- ▶ **Conditional operator (? :)**

Question No: 28 (Marks: 1) - Please choose one

Suppose obj1 and obj2 are two objects of a user defined class A. An + operator is overloaded to add obj1 and obj2 using the function call obj1+obj2. Identify the correct function prototype against the given call?

- ▶ A operator + (A &obj);
- ▶ int + operator();
- ▶ **int operator (plus) ();**
- ▶ A operator(A &obj3);

Question No: 29 (Marks: 1) - Please choose one

Default constructor is such constructor which either has no -----or if it has some parameters these have ----- values

- ▶ Parameter, temporary
- ▶ Null, Parameter
- ▶ **Parameter, default**
- ▶ non of the given

Question No: 30 (Marks: 1) - Please choose one

Public methods of base class can ----- be accessed in its derived class

- ▶ directly
- ▶ **indirectly**
- ▶ simultaneously
- ▶ non of the given

Question No: 31 (Marks: 1)

Is **Deque** a Birectional Container?

Yes, deque behaves like queue (line) such that we can add elements on both sides of it.

Question No: 32 (Marks: 1)

What is meant by Generic Programming?

Generic programming refers to programs containing generic abstractions general code that is same in logic for all data types like printArray function), then we instantiate that generic program abstraction (function, class) for a particular data type, such abstractions can work with many different types of data.

Question No: 33 (Marks: 2)

Sort the following data in the order in which compiler searches a function?

Complete Specialization, Generic Template, Partial Specialization, Ordinary Function.

Specializations of this function template, instantiations with specific types, can be called just like an ordinary function:

```
cout << max(3, 7); // outputs 7
```

The compiler examines the arguments used to call max and determines that this is a call to max(int, int). It then instantiates a version of the function where the parameterizing type T is int, making the equivalent of the following function:

```
int max(int x, int y)
{
    return x < y ? y : x;
}
```

the C++ Standard Template Library contains the function template max(x, y) which creates functions that return either x or y, whichever is larger. max() could be defined like this:

```
template <typename T>
T max(T x, T y)
{
    return x < y ? y : x;
}
```

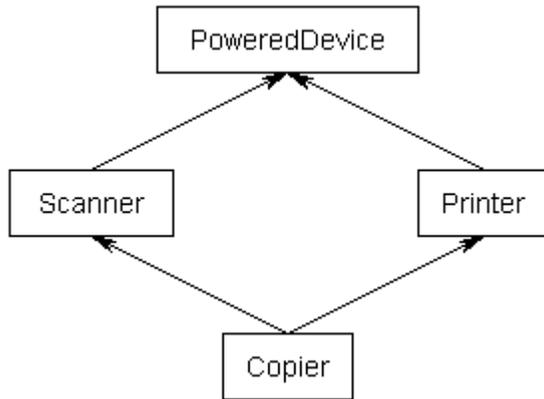

Question No: 34 (Marks: 2)

State any conflict that may rise due to multiple inheritance?

The conflict may arise is the diamond problem, which our author likes to call the “diamond of doom”. This occurs when a class multiply inherits from two classes which each inherit from a single base class. This leads to a diamond shaped inheritance pattern.

For example, consider the following set of classes:

```
class PoweredDevice
{
};
class Scanner: public PoweredDevice
{
};
class Printer: public PoweredDevice
{
};
class Copier: public Scanner, public Printer
{
};
```

Scanners and printers are both powered devices, so they derived from PoweredDevice. However, a copy machine incorporates the functionality of both Scanners and Printers.

Ambiguity also cause problem.

Question No: 35 (Marks: 3)

Describe three properties necessary for a container to implement Generic Algorithms.

If you declare a container as holding pointers, you are responsible for managing the memory for the objects pointed to. The container classes will not automatically free memory for these objects when an item is erased from the container.

Container classes are expected to implement methods to do the following:

- create a new empty container (constructor),
- report the number of objects it stores (size),
- delete all the objects in the container (clear),
- insert new objects into the container,
- remove objects from it,
- provide access to the stored objects.

Question No: 36 (Marks: 3)

Write three important features of virtual functions.

With virtual functions, derived classes can provide new implementations of functions from their base classes. When someone calls a virtual function of an object of the derived class, this new implementation is called, even if the caller uses a pointer to the base class, and doesn't even know about the particular derived class.

The virtual function is an option, and the language defaults to non virtual, which is the fastest configuration.

The derived class can completely "override" the implementation or "augment" it (by explicitly calling the base class implementation in addition to the new things it does).

Question No: 37 (Marks: 3)

Consider the code below,

```
#include <iostream>
#include <stdlib.h>
using namespace std;
class Shape{
    public:
    void Draw(){cout<<"shape"<<endl;}
};
class Line : public Shape{
    public:
    void Draw(){cout<<"Line"<<endl;}
};
class Circle : public Shape{
    public:
    void Draw(){cout<<"Circle"<<endl;}
};
int main(int argc, char *argv[])
{
    Shape * ptr1 = new Shape();
    Shape * ptr2 = new Line();
    Shape * ptr3 = new Circle();

    ptr1->Draw();
    ptr2->Draw();
    ptr3->Draw();
    system("PAUSE");
    return 0;
}
```

This code shows output,

Shape
Shape
Shape

Give the reason for this output

Suppose we want to show the output,

Shape
Line
Circle

How we can change the code to do that?

```
class shape { public:  
    void draw();  
};  
class circle : public shape { };  
int main(int argc, char **argv){  
    circle my_circle;  
    my_circle.draw();  
}
```

While this has all the usual advantages, e.g., code reuse, the real power of polymorphism comes into play when draw is declared to be virtual or pure virtual, as follows:

```
class shape{ public:  
    virtual void draw()=0;  
};  
class circle : public shape { public:  
    void draw();  
}
```

Here, circle has declared its own draw function, which can define behavior appropriate for a circle. Similarly, we could define other classes derived from shape, which provide their own versions of draw. Now, because all the classes implement the shape interface, we can create collections of objects that can provide different behavior invoked in a consistent manner (calling the draw member function). An example of this is shown here.

```
shape *shape_list[3]; // the array that will  
                    // pointer to our shape objects  
shape[0] = new shape; // three types of shapes  
shape[1] = new line; // we have defined  
shape[2] = new circle;  
for(int i = 0; i < 3; i++){  
    shape_list[i].draw();  
}
```

When we invoke the draw function for each object on the list, we do not need to know anything about each object; C++ handles the details of invoking the correct version of draw. This is a very powerful technique, allowing us to provide extensibility in our designs. Now we can add new classes derived from shape to provide whatever behavior we desire. The key here is that we have separated the interface (the prototype for shape) from the implementation.

Question No: 38 (Marks: 5)

There are some errors in the code given below, you have to

1. Indicate the line no. with error/s
2. Give the reason for error/s
3. Correct the error/s.

1. #include <iostream> this will be #include <iostream.h>
2. #include <stdlib.h>

3. using namespace std;
4. template <typename T>
5. class MyClass{
6. public:
7. MyClass(){
8. cout<<"This is class1"<<endl;
9. }
10. };
11. template <typename T>
12. class MyClass<int*>{
13. public:
14. MyClass(){
15. cout<<"This is class2"<<endl;
16. }
17. };
18. int main(int argc, char *argv[])
19. {
20. MyClass<int> c1;
21. MyClass<int*> c2;
22. system("PAUSE");
23. return 0;
24. }

Question No: 39 (Marks: 5)

Given are two classes A and B. class B is inherited from class A. Write a code snippet(for main function) that polymorphically call the method of class B. Also what changes do you suggest in the given code segment that are required to call the class B method polymorphically.

```
class A
{
public:
void method() { cout<<"A's method \n"; }

};

class B : public A
{

public:
void method() { cout<<"B's method\n"; }
```

```
};
```

Ans:

```
public class Test
{
public class A {}

public class B extends A {}

private void test(A a)
{
System.out.println("test(A)");
}

private void test(B b)
{
System.out.println("test(B)");
}

public static void main(String[] args)
{
Test t = new Test();
A a = t.new A();
A b = t.new B();

t.test(a);
t.test(b);
}
}
```

Question No: 40 (Marks: 10)

Create built-in STL (Standard Template Library) **vector class object** for **strings** and add in it some words by taking input from user, then apply the sort() algorithm to array of words stored in this vector class object.

Hint: Use push_back() to add the words in vector class object, and the [] operator and size() to display these sorted words.

The STL is the containers, iterators and algorithms component of the proposed C++ Standard Library [ANSI95]. It represents a novel application of principles which have their roots in styles of programming other than Object-orientation.

```
void listWords(istream& in, ostream& out)
```

```

{
    string s;

    while (!in.eof() && in >> s) {
        add s to some container
    }

    sort the strings in the container
    remove the duplicates

    for (each string t in container) {
        out << t;
    }
}

```

For now, assume that a word is defined as a whitespace-separated string as delivered by the stream extraction operator. Later on we will consider ways of refining this definition. Given the way this problem is expressed, we can implement this program directly, if naïvely. The STL container class `vector` will suffice to hold the words: applying the algorithms `sort` and `unique` provides the required result.

```

void listWords(istream& in, ostream& out)
{
    string s;
    vector<string> v;

    while (!in.eof() && in >> s)
        v.push_back(s);          // (1)

    sort(v.begin(), v.end());

    vector<string>::iterator e
        = unique(v.begin(), v.end()); // (2)

    for (vector<string>::iterator b = v.begin();
         b != e;
         b++) {
        out << *b << endl;
    }
}

```

At (1) the vector member function `push_back()` is used to add to the end of the vector. This can also be done using the `insert` member, which takes as a parameter an iterator identifying the position in the vector at which to place the added element:

```

v.insert(v.end(), s);

```

This allows us to add at any position in the vector. Be aware, though, that adding anywhere other than the end implies the overhead of physically shifting all elements from the insertion point to the end to make room for the new value. For this reason, and given the choices made in this example, attempts to optimise this code by maintaining the

vector in sorted order are unwise. Replace vector with list and this becomes possible - although in both cases a search over the container will be necessary to determine the correct position of insertion.

The unique algorithm has the surprising property of not changing the length of the container to which it is applied (it can hardly do this, as it has access not to the underlying container, but only to the pair of iterators it is passed). Instead, it guarantees that duplicates are removed by moving unique entries towards the beginning of the container, returning an iterator indicating the new end of the container. This can be used directly (as here, at (2)), conversely it can be passed to the erase member with the old end iterator, to truncate the container.

Question No: 41 (Marks: 10)

Q. Write a detailed note on Exceptions in Destructors with the help of a coding example.

Exceptions in Destructors:

An object is presumably created to do something. Some of the changes made by an object should persist after an object dies (is destructed) and some changes should not. Take an object implementing a SQL query. If a database field is updated via the SQL object then that change should persist after the SQL objects dies. To do its work the SQL object probably created a database connection and allocated a bunch of memory. When the SQL object dies we want to close the database connection and deallocate the memory, otherwise if a lot of SQL objects are created we will run out of database connections and/or memory.

The logic might look like:

```
Sql::~Sql()
{
    delete connection;
    delete buffer;
}
```

Let's say an exception is thrown while deleting the database connection. Will the buffer be deleted? No. Exceptions are basically non-local gotos with stack cleanup. The code for deleting the buffer will never be executed creating a gaping resource leak.

Special care must be taken to catch exceptions which may occur during object destruction. Special care must also be taken to fully destruct an object when it throws an exception.

Example code for exception

```
#include<iostream.h>
#include<conio.c>
class Exception {
private:
```

```

char message[30] ;
public:

Exception() {strcpy(message,"There is not enough stock");}
char * get_message() { return message; }
};
class Item {
private:

int stock ;
int required_quantity;
public:

Item(int stk, int qty)
{
    stock = stk;
    required_quantity = qty;
}
int get_stock()
{
    return stock;
}

int get_required_quantity()
{
    return required_quantity;
}

void order()
{
    if (get_stock()< get_required_quantity())

        throw Exception();
        else
            cout<<"The required quantity of item is available in the stock";
}

~Item(){}
};

void main()
{

    Item obj(10, 20);

try

```

```
{
    obj.order();
}
catch(Exception & exp2)
{
    getch();
    cout << "Exception: " << exp2.get_message() << endl;
}
getch();
```

FINALTERM EXAMINATION
Fall 2009
CS304- Object Oriented Programming (Session - 4)

Ref No: 1130772
Time: 120 min
Marks: 75

Question No: 1 (Marks: 1) - Please choose one

A template provides a convenient way to make a family of

- ▶ **variables and data members**
- ▶ functions and classes
- ▶ classes and exceptions
- ▶ programs and algorithms

Question No: 2 (Marks: 1) - Please choose one

Which one of the following terms must relate to **polymorphism**?

- ▶ Static allocation
- ▶ Static typing
- ▶ **Dynamic binding**
- ▶ Dynamic allocation

Question No: 3 (Marks: 1) - Please choose one

What is true about function templates?

- ▶ The compiler generates only one copy of the function template
- ▶ **The compiler generates a copy of function respective to each type of data**
- ▶ The compiler can only generate copy for the int type data
- ▶ None of the given.

Question No: 4 (Marks: 1) - Please choose one

Which of the following is the best approach if it is required to have more than one functions having exactly same functionality and implemented on different data types?

- ▶ **Templates**
- ▶ Overloading
- ▶ Data hiding
- ▶ Encapsulation

Question No: 5 (Marks: 1) - Please choose one

```
template <>
class Vector<char*> { }
```

This is an example of partial specialization.

- ▶ True
- ▶ **False**

Question No: 6 (Marks: 1) - Please choose one

Classes like TwoDimensionalShape and ThreeDimensionalShape would normally be concrete, while classes like Sphere and Cube would normally be abstract.

- ▶ **True**
- ▶ False

Question No: 7 (Marks: 1) - Please choose one

A non-virtual member function is defined in a base class and overridden in a derived class; if that function is called through a base-class pointer to a derived class object, the derived-class version is used.

▶ **True**

▶ False

Question No: 8 (Marks: 1) - Please choose one

Assume a class Derv that is privately derived from class Base. An object of class Derv located in main() can access

- ▶ public members of Derv.
- ▶ **protected members of Derv.**
- ▶ private members of Derv.
- ▶ protected members of Base.

Question No: 9 (Marks: 1) - Please choose one

In order to define a class template, the first line of definition must be:

- ▶ **template <typename T>**
- ▶ typename <template T>
- ▶ Template Class <ClassName>
- ▶ Class <Template T>

Question No: 10 (Marks: 1) - Please choose one

If there is a pointer p to objects of a base class, and it contains the address of an object of a derived class, and both classes contain a nonvirtual member function, ding(), then the statement p->ding(); will cause the version of ding() in the _____ class to be executed.

- ▶ Base
- ▶ Derived

- ▶ Abstract
- ▶ **virtual**

Question No: 11 (Marks: 1) - Please choose one

When the base class and the derived class have a member function with the same name, you must be more specific which function you want to call (using _____).

- ▶ scope resolution operator
- ▶ dot operator
- ▶ **null operator**
- ▶ Operator overloading

Question No: 12 (Marks: 1) - Please choose one

Non Template Friend functions of a class are friends of _____instance/s of that class.

- ▶ All
- ▶ **One specific**
- ▶ All instances of one date type
- ▶ None of the given options

Question No: 13 (Marks: 1) - Please choose one

The find() algorithm

- ▶ finds matching sequences of elements in two containers.
- ▶ **finds a container that matches a specified container.**
- ▶ takes iterators as its first two arguments.
- ▶ takes container elements as its first two arguments.

Question No: 14 (Marks: 1) - Please choose one

If you define a vector v with the default constructor, and define another vector w with a one-argument constructor to a size of 11, and insert 3 elements into each of these vectors with push_back(), then the size() member function will return _____ for v and _____ for w.

- ▶ 11 for v and 3 for w.

- ▶ 0 for v and 0 for w.
- ▶ 0 for v and 3 for w.
- ▶ **3 for v and 11 for w.**

Question No: 15 (Marks: 1) - Please choose one

Which of the following may not be an integral part of an object?

- ▶ State
- ▶ Behavior
- ▶ Protected data members
- ▶ **All of given**

Question No: 16 (Marks: 1) - Please choose one

Which is not the Advantage of inheritance?

- ▶ providing class growth through natural selection.
- ▶ **facilitating class libraries.**
- ▶ avoiding the rewriting of code.
- ▶ providing a useful conceptual framework.

Question No: 17 (Marks: 1) - Please choose one

```
class DocElement
{
public:
    virtual void Print() { cout << "Generic element"; }
};
class Heading : public DocElement
{
public:
    void Print() { cout << "Heading element"; }
};
class Paragraph : public DocElement
{
public:
    void Print() { cout << "Paragraph element"; }
};
```

```
void main()
{
    DocElement * p = new Paragraph();

    p->Print();
}
```

When you run this program, it will print out a single line to the console output.

What will be in that line?

Select one correct answer from the following list:

- ▶ Generic element
- ▶ Heading element
- ▶ **Paragraph element**
- ▶ Nothing will be printed.

Question No: 18 (Marks: 1) - Please choose one

When a virtual function is called by referencing a specific object by name and using the dot member selection operator (e.g., squareObject.draw()), the reference is resolved at compile time.

- ▶ **True**
- ▶ False

Question No: 19 (Marks: 1) - Please choose one

In case of multiple inheritance a derived class inherits,

- ▶ Only the public member functions of its base classes
- ▶ Only the public data members of its base classes
- ▶ **Both public data members and member functions of all its base classes**
- ▶ Data members and member functions of any two base classes

Question No: 20 (Marks: 1) - Please choose one

When we write a class template the first line must be:

- ▶ `template < class class_name>`
- ▶ `template < class data_type>`
- ▶ **template < class T >**

Here T can be replaced with any name but it is preferable.

- ▶ `class class-name()`
- `class template<class_name>`

Question No: 21 (Marks: 1) - Please choose one

Which of the following is incorrect line regarding function template?

- ▶ `template<class T>`
- ▶ `template <typename U>`
- ▶ **Class<template T>**
- ▶ `template < class T, class U>`

Question No: 22 (Marks: 1) - Please choose one

An STL container can not be used to,

- ▶ **hold objects of class employee.**
- ▶ store elements in a way that makes them quickly accessible.
- ▶ compile c++ programs.
- ▶ organize the way objects are stored in memory

Question No: 23 (Marks: 1) - Please choose one

Algorithms can only be implemented using STL containers.

- ▶ **True**
- ▶ False

Question No: 24 (Marks: 1) - Please choose one

Consider a class named Vehicle, which of the following can be the instance of class Vehicle?

1. Car
2. Computer
3. Desk
4. Ahmed
5. Bicycle
6. Truck

▶ 1, 4, 5

▶ 2, 5, 6

▶ 1, 2, 3, 6

▶ **1, 5, 6**

Question No: 25 (Marks: 1) - Please choose one

Consider the code below,

```
class Fred {
public:
Fred();
...
};
int main()
{
Fred a[10];
Fred* p = new Fred[10];
...
}
```

Select the best option,

▶ Fred a[10]; calls the default constructor 09 times

Fred* p = new Fred[10]; calls the default constructor 10 times

▶ Produce an error

▶ **Fred a[10]; calls the default constructor 11 times**

Fred* p = new Fred[10]; calls the default constructor 11 times

▶ Fred a[10]; calls the default constructor 10 times

Fred* p = new Fred[10]; calls the default constructor 10 times

Question No: 26 (Marks: 1) - Please choose one

When a variable is define as **static** in a class then all object of this class,

- ▶ Have different copies of this variable
- ▶ **Have same copy of this variable**
- ▶ Can not access this variable
- ▶ None of given

Question No: 27 (Marks: 1) - Please choose one

The life of sub object is dependant on the life of master class in _____.

- ▶ Separation
- ▶ **Composition**
- ▶ Aggregation
- ▶ None of the given

Question No: 28 (Marks: 1) - Please choose one

_____, which means if A declares B as its friend it does NOT mean that A can access private data of B. It only means that B can access all data of A.

- ▶ **Friendship is one way only**
- ▶ Friendship is two way only
- ▶ NO Friendship between classes
- ▶ Any kind of friendship

Question No: 29 (Marks: 1) - Please choose one

Which of the following operators always takes no argument if overloaded?

- ▶ /
- ▶ -
- ▶ +
- ▶ **++**

Question No: 30 (Marks: 1) - Please choose one

In Private ----- only member functions and friend classes or functions of a derived class can convert pointer or reference of derived object to that of parent object

- ▶ specialization
- ▶ inheritance
- ▶ abstraction
- ▶ composition

Question No: 31 (Marks: 1)

Write the syntax of declaring a pure virtual function in a class?

Ans:

Pure Virtual Function is a Virtual function with no body.

Declaration of Pure Virtual Function:

Since pure virtual function has no body, the programmer must add the notation =0 for declaration of the pure virtual function in the base class.

General Syntax of Pure Virtual Function takes the form:

```
class classname //This denotes the base class of C++ virtual function
{
public:
virtual void virtualfunctionname() = 0 //This denotes the pure virtual function in C++
};
```

Question No: 32 (Marks: 1)

What is meant by direct base class ?

Ans

When a class-type is included in the class-base, it specifies the direct base class of the class being declared. If a class declaration has no class-base, or if the class-base lists only interface types, the direct base class is assumed to be object. A class inherits members from its direct base class,

Deriving a class from more than one *direct base class* is called multiple inheritance.

Question No: 33 (Marks: 2)

Describe the way to declare a template class as a friend class of any other class.

Ans

The following example is use of a class template:

```
template<class L> class Key
    {
        L k;
        L* kptr;
        int length;
public:
        Key(L);
        // ...
};
```

Suppose the following declarations appear later:

```
Key<int> i;
Key<char*> c;
Key<mytype> m;
```

The compiler would create three objects.

Question No: 34 (Marks: 2)

What is the purpose of template parameter?

Ans:

There are three kinds of template parameters:

- type
- non-type
- template

You can interchange the keywords **class** and **typename** in a template parameter declaration. You cannot use storage class specifiers (**static** and **auto**) in a template parameter declaration.

Question No: 35 (Marks: 3)

Describe in simple words how we can use template specialization to enforce case sensitive specialization in String class.

Ans”

The act of creating a new definition of a function, class, or member of a class from a template declaration and one or more template arguments is called template instantiation. The definition created from a template instantiation is called a specialization. A primary template is the template that is being specialized.

create function objects to do the case-insensitive compares, and then reuse them when also wanting to do case-insensitive sorting or searching.

Question No: 36 (Marks: 3)

Can we use compiler generated default assignment operator in case our class is using dynamic memory? Justify your answer.

Ans:

the compiler does not make a separate copy of the object. Even if the types are not the same, the compiler is usually able to do a better job with initialization lists than with assignments.

Consider the following constructor that initializes member object `x_` using an initialization list: `square::square() : x_(whatever) { }`. The most common benefit of doing this is improved performance. For example, if the expression *whatever* is the same type as member variable `x_`, the result of the *whatever* expression is constructed directly inside `x_` — the compiler does not make a separate copy of the object. Even if the types are not the same, the compiler is usually able to do a better job with initialization lists than with assignments.

As if that wasn't bad enough, there's another source of inefficiency when using assignment in a constructor: the member object will get fully constructed by its default constructor, and this might, for example, allocate some default amount of memory or open some default file. All this work could be for naught if the *whatever* expression and/or assignment operator causes the object to close that file and/or release that memory (e.g., if the default constructor didn't allocate a large enough pool of memory or if it opened the wrong file).

Question No: 37 (Marks: 3)

Give the names of three ways to handle errors in a program.

Ans:

The function will throw `DivideByZero` as an exception that can then be caught by an exception-handling catch statement that catches exceptions of type `int`. The necessary construction for catching exceptions is a try catch system. If you wish to have your program check for exceptions, you must enclose the code that may have exceptions thrown in a try block.

The catch statement catches exceptions that are of the proper type. You can, for example, throw objects of a class to differentiate between several different exceptions. As well, once a catch statement is executed, the program continues to run from the end of the catch.

the errors can be handled outside of the regular code. This means that it is easier to structure the program code, and it makes dealing with errors more centralized. Finally, because the exception is passed back up the stack of calling functions, you can handle errors at any place you choose.

Question No: 38 (Marks: 5)

Consider the following code,

```

class Base{
    private:
    void base1();
    protected:
    void base2();
    public:
    void base3();
};

class Derived: public Base{
    private:
    void derived1();
    protected:
    void derived2();
    public:
    void derived3();
};

int main(){
Derived * derived = new Derived();
return 0;
}

```

Fill the table below to tell which member functions of Base and Derived classes we can access using the **Derived** pointer in the code indicated in bold.

Ans:

Function Name	Availability (Yes / No)?
base2()	no
base3()	yes
derived1()	No
derived2()	No
derived3()	Yes

Question No: 39 (Marks: 5)

What is the output produced by the following program?

```
#include<iostream.h>
```

```
void sample_function(double test) throw (int);
```

```

int main()
{
    try
    {
        cout << "Trying.\n";
        sample_function(98.6);
        cout << "Trying after call.\n";
    }
    catch(int)
    {
        cout << "Catching.\n";
    }

    cout << "End program.\n";
    return 0;
}
void sample_function(double test) throw (int)
{
    cout << "Starting sample_function.\n";
    if(test < 100)
        throw 42;
}

```

Ans:

Starting sample_function

Trying

Trying after call

Catching

End program

Question No: 40 (Marks: 10)

Write a publicly derived class “**Employee**” that is derived from base class named “**Company**”. Both classes will have function “**create()**”. Make virtual function of base class and override same function in derived class. Function create will have an output statement of your own choice.

In “**main**” Create an object of base class and call both functions with same object type.

Question No: 41 (Marks: 10)

Write a program in C++ which creates three classes named as

1. **Equation**
2. **Linear**
3. **Quadratic**

Where Linear and Quadratic are inherited from Equation

Each class has the method Graph. Graph method should be pure virtual in Equation class.

This method should be overridden in both the inherited classes. It is meant to display the Graph shape of its respective class. Graph method of Linear will display the message;

Straight line

Similarly, the Graph method of Quadratic will display the message;

Parabola

In main, call the Graph method of both the Linear and Quadratic equations polymorphically through the parent class (Equation).

Ans:

```
#include "fraction.h"
#include <iostream>
#include <string>
#include <string.h>
#include <stdlib.h>
class equation;

class equation {
    int a, b;
public:
    int c ()
        {return (c);}
    void convert (Cequation);
};

class linear {
private:
    int side;
public:
    void set_side (int a)
        {side=a;}
    friend class equation;
};
```

```
void equation::convert (Cequation) {  
    a = 23;  
    b = 45;  
}
```

```
int main () {  
    cequation sqr;  
    CRectangle rect;  
    sqr.set_side(4);  
    rect.convert(sqr);  
    cout << rect.area();  
    return 0;  
}
```

CS304 Solved By Ms.Shazia

Date: 08-11-2010

Question # 1 of 10

Information hiding can be achieved through_____.

1. Encapsulation, Inheritance
2. Encapsulation, Polymorphism
- 3. Encapsulation, Abstraction**
4. Overloading

Question # 2 of 10 (Start time: 01:11:21 AM) Total Marks: 1

A good model is related to a real life problem.

Select correct option:

1. Loosely
2. Openly
- 3. Closely**

Question # 3 of 10 (Start time: 01:12:33 AM) Total Marks: 1

Which of the following features of OOP is used to derive a class from another?

Select correct option:

1. Encapsulation
2. Polymorphism

3. Data hiding

4. Inheritance

Question # 4 of 10 (Start time: 01:13:51 AM) Total Marks: 1

Which of the following is a weak relationship between two objects?

Select correct option:

1. Inheritance

2. Composition

3. Aggregation

4. None of given

Question # 5 of 10 (Start time: 01:14:56 AM) Total Marks: 1

Data items in a class must be private.

Select correct option:

1. True

2. False

Question # 6 of 10 (Start time: 01:15:52 AM) Total Marks: 1

Which one is a class association

Select correct option:

1. Simple Association

2. Inheritance

3. Composition

4. Aggregation

Question # 7 of 10 (Start time: 01:16:55 AM) Total Marks: 1

Suppose there is an object of type Person, which of the following can be considered as one of its attributes

Select correct option:

1. Name
2. Age
3. Work()
- 4. Both Name and Age**

Question # 8 of 10 (Start time: 01:17:52 AM) Total Marks: 1

Which one is not an object association?

Select correct option:

1. Simple association
- 2. Inheritance**
3. Aggregation
4. Association

Question # 9 of 10 (Start time: 01:18:50 AM) Total Marks: 1

Using encapsulation we can achieve

Select correct option:

- 1. Information hiding**
2. Least interdependencies among modules
3. Implementation independence
4. All of given options

Question # 10 of 10 (Start time: 01:19:43 AM) Total Marks: 1

In constant member function the type of this pointer is:

Select correct option:

1. Constant pointer
- 2. Constant pointer to object**
3. Constant pointer to class
4. Constant pointer to constant object

Question # 1 of 10

Which of the following is the way to extract common behavior and attributes from the given classes and make a separate class of those common behaviors and attributes?

- 1. Generalization**
2. Sub-typing
3. Specialization
4. Extension

Question # 2 of 10

The ability to derive a class from more than one class is called

1. Single inheritance
2. Encapsulation
- 3. Multiple inheritance**
4. Polymorphism

Question # 3 of 10:

If MyClass has a destructor what is the destructor named?

1. MyClass
- 2. ~MyClass**
3. My~Class
4. MyClass~

Question # 4 of 10:

Class abc{ ----- }; Is a valid class declaration?

- 1. yes**
2. no

Question # 5 of 10:

Without using Deep copy constructor, A _____ problem can occur

1. System crash
2. Memory Leakage
3. Dangling pointer
- 4. All of the given**

Question # 6 of 10:

If only one behaviour of a derived class is incompatible with base class, then it is:

1. Generalization
- 2. Specialization**
3. Extension

4. Inheritance

Question # 7 of 10:

Which of the following may not be an integral part of an object?

1. state
2. behavior
3. Protected data members
- 4. All of given**

Question # 8 of 10:

Only tangible things can be chosen as an object.

1. True
- 2. False**

- 1.
2. Question # 1 of 10
Information hiding can be achieved through _____.
Encapsulation, Inheritance
Encapsulation, Polymorphism
Encapsulation, Abstraction
Overloading

Question # 2 of 10 (Start time: 01:11:21 AM) Total Marks: 1

A good model is related to a real life problem.

Select correct option:

- Loosely

Which one is not an object association?

Select correct option:

Simple association

Inheritance

Aggregation

Association

Question # 9 of 10 (Start time: 01:18:50 AM) Total Marks: 1

Using encapsulation we can achieve

Select correct option:

Information hiding

Least interdependencies among modules

Implementation independence

All of given options

Question # 10 of 10 (Start time: 01:19:43 AM) Total Marks: 1

In constant member function the type of this pointer is:

Select correct option:

Constant pointer

Constant pointer to object

Constant pointer to class

Constant pointer to constant object

Question # 1 of 10

Which of the following is the way to extract common behavior and attributes from the given classes and make a separate class of those common behaviors and attributes?

Generalization

Sub-typing

Specialization

Extension

Question # 2 of 10

The ability to derive a class from more than one class is called

Single inheritance

Encapsulation

Multiple inheritance

Polymorphism

Question # 3 of 10:

If MyClass has a destructor what is the destructor named?

MyClass

~MyClass

My~Class

MyClass~

Question # 4 of 10:

Class abc{ ----- }; Is a valid class declaration?

yes

no

Question # 5 of 10:

Without using Deep copy constructor, A _____ problem can occur

System crash

Memory Leakage

Dangling pointer

All of the given

Question # 6 of 10:

If only one behaviour of a derived class is incompatible with base class, then it is:

Generalization

Specialization

Extension

Inheritance

Question # 7 of 10:

Which of the following may not be an integral part of an object?

state

behavior

Protected data members

All of given

Question # 8 of 10:

Only tangible things can be chosen as an object.

True

False

Class is not a mechanism to create objects and define user data types.

1. true
2. **false**

Memory is allocated to non static members only, when:

1. Class is created
2. Object is defined
3. Object is initialized
4. **Object is created**

The sub-object's life is not dependent on the life of master class in _____.

1. Composition
2. **Aggregation**
3. Separation
4. non of the given

Unary operators and assignment operator are right associative.

1. true
2. false

The \geq operator can't be overloaded.

1. true
2. false

_____ is creating objects of one class inside another class.

1. Association
2. Composition
3. Aggregation
4. Inheritance

If we are create array of objects through new operator, then

1. We can call overloaded constructor through new
2. We can't call overloaded constructor through new
3. We can call default constructor through new
4. None of the given

Object can be declared constant with the use of Constant keyword.

1. true
2. false

_____ Operator will take only one operand.

1. New
2. int
3. object
4. none of the given

Which of the following operator(s) take(s) one or no argument if overloaded?

1. ++
2. *
3. %

4. All of the given choices

this pointer does not pass implicitly to _____ functions.

1. Static Member
2. Non-Static Member
3. Instance Number
4. None of the given

Operator overloading is

1. making C++ operators work with objects.
2. giving C++ operators more than they can handle.
3. giving new meanings to existing Class members.
4. making new C++ operators

CS304- Object Oriented Programming (Session - 3)

Question No: 1 (Marks: 1) - Please choose one

Which of the following causes run time binding?

- ▶ Declaring object of abstract class
- ▶ Declaring pointer of abstract class
- ▶ **Declaring overridden methods as non-virtual (Page 226)**
- ▶ None of the given

Question No: 2 (Marks: 1) - Please choose one

Which of the following is the best approach if it is required to have more than one functions having exactly same functionality and implemented on different data types?

- ▶ **Templates (Page 256)**
- ▶ Overloading
- ▶ Data hiding
- ▶ Encapsulation

Question No: 3 (Marks: 1) - Please choose one

A copy constructor is invoked when

- ▶ a function do not returns by value.
- ▶ **an argument is passed by value. (Page 78)**
- ▶ a function returns by reference.
- ▶ an argument is passed by reference.

Question No: 4 (Marks: 1) - Please choose one

Like template functions, a class template may not handle all the types successfully.

- ▶ **True (Page 258)**
- ▶ False

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

Question No: 6 (Marks: 1) - Please choose one

A class template may inherit from another class template.

- ▶ **True (Page 288)**
- ▶ False

Question No: 7 (Marks: 1) - Please choose one

By default the vector data items are initialized to _____

- ▶ **0 [Click here for detail](#)**
- ▶ 0.0
- ▶ 1
- ▶ null

Question No: 8 (Marks: 1) - Please choose one

In Private ----- only member functions and friend classes or functions of a derived class can convert pointer or reference of derived object to that of parent object

- ▶ specialization
- ▶ **inheritance (Page 216)**
- ▶ abstraction
- ▶ composition

Question No: 9 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

- ▶ Reusability
- ▶ Writability
- ▶ Maintainability
- ▶ **All of given (Page 256)**

Question No: 10 (Marks: 1) - Please choose one

Template functions use _____ than ordinary functions.

- ▶ Greater Memory
- ▶ **Lesser Memory**
- ▶ Equal Memory
- ▶ None of the given options

Question No: 11 (Marks: 1) - Please choose one

Non Template Friend functions of a class are friends of _____ instance/s of that class.

- ▶ **All [Click here for detail](#)**
- ▶ One specific
- ▶ All instances of one data type
- ▶ None of the given options

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

Question No: 12 (Marks: 1) - Please choose one

A copy constructor is invoked when

- ▶ a function do not returns by value.
- ▶ **an argument is passed by value.** (Page 78)
- ▶ a function returns by reference.
- ▶ an argument is passed by reference.

Question No: 13 (Marks: 1) - Please choose one

A pointer to a base class can point to objects of a derived class.

- ▶ **True** [Click here for detail](#)
- ▶ False

Question No: 14 (Marks: 1) - Please choose one

A template argument is preceded by the keyword _____.

- ▶ vector
- ▶ **class** [Click here for Detail](#)
- ▶ template
- ▶ type*

Question No: 15 (Marks: 1) - Please choose one

Which one of the following terms must relate to **polymorphism**?

- ▶ Static allocation
- ▶ Static typing
- ▶ **Dynamic binding** (Page 239)
- ▶ Dynamic allocation

Question No: 16 (Marks: 1) - Please choose one

Multiple inheritance can be of type

- ▶ Public
- ▶ Private
- ▶ Protected
- ▶ **All of the given** [Click here for detail](#)

Question No: 17 (Marks: 1) - Please choose one

Assume a class Derv that is privately derived from class Base. An object of class Derv located in main() can access

- ▶ **public members of Derv.** (Object-Oriented Programming in C++)
- ▶ protected members of Derv.
- ▶ private members of Derv.
- ▶ protected members of Base.

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari

Question No: 18 (Marks: 1) - Please choose one

A copy constructor is invoked when

- ▶ a function do not returns by value.
- ▶ **an argument is passed by value. (Page 78) (rep)**
- ▶ a function returns by reference.
- ▶ an argument is passed by reference.

Question No: 19 (Marks: 1) - Please choose one

A function call is resolved at run-time in _____

- ▶ non-virtual member function.
- ▶ **virtual member function. (Page 239)**
- ▶ Both non-virtual member and virtual member function.
- ▶ None of given

Question No: 20 (Marks: 1) - Please choose one

Two important STL associative containers are _____ and _____.

- ▶ **set,map (Object-Oriented Programming in C++)**
- ▶ sequence,mapping
- ▶ setmet,multipule
- ▶ sit,mat

Question No: 21 (Marks: 1) - Please choose one

An abstract class is useful when,

- ▶ We do not derive any class from it.
- ▶ There are multiple paths from one derived class to another.
- ▶ **We do not want to instantiate its object. (Object-Oriented Programming in C++)**
- ▶ You want to defer the declaration of the class.

Question No: 22 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

- ▶ Reusability
- ▶ Writability
- ▶ Maintainability
- ▶ **All of given (Page 256) rep**

Question No: 23 (Marks: 1) - Please choose one

By default the vector data items are initialized to _____

- ▶ **0 (Click here for Detail) rep**
- ▶ 0.0
- ▶ 1
- ▶ null

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

Question No: 24 (Marks: 1) - Please choose one

Suppose you create an uninitialized vector as follows:

```
vector<int> evec;
```

After adding the statement,

```
evec.push_back(21);
```

what will happen?

- ▶ The following statement will add an element to the start (the back) of evec and will initialize it with the value 21.
- ▶ The following statement will add an element to the center of evec and will reinitialize it with the value 21.
- ▶ The following statement will delete an element to the end (the back) of evec and will reinitialize it with the value 21.
- ▶ **The following statement will add an element to the end (the back) of evec and initialize it with the value 21. [Click here for detail](#)**

Question No: 25 (Marks: 1) - Please choose one

Default constructor is such constructor which either has no -----or if it has some parameters these have ----
--- values

- ▶ Parameter, temporary
- ▶ Null, Parameter
- ▶ **Parameter, default (Page 75)**
- ▶ non of the given

Question No: 26 (Marks: 1) - Please choose one

Which of the following is the best approach if it is required to have more than one functions having exactly same functionality and implemented on different data types?

- ▶ **Templates (Page 256) rep**
- ▶ Overloading
- ▶ Data hiding
- ▶ Encapsulation

Question No: 27 (Marks: 1)

Describe the way to declare a template class as a friend of any class.

Question No: 28 (Marks: 1)

Classes like TwoDimensionalShape and ThreeDimensionalShape would normally be concrete, while classes like Sphere and Cube would normally be abstract.

- ▶ **True [Click here for detail](#)**
- ▶ False

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

Question No: 29 (Marks: 1)

In order to define a class template, the first line of definition must be:

- ▶ **template <typename T> (Page 257)**
- ▶ typename <template T>
- ▶ Template Class <ClassName>
- ▶ Class <Template T>

Question No: 30 (Marks: 1)

In case of multiple inheritance a derived class inherits,

- ▶ Only the public member functions of its base classes
 - ▶ Only the public data members of its base classes
 - ▶ **Both public data members and member functions of all its base classes**
- [Click here for detail](#)
- ▶ Data members and member functions of any two base classes

Question No: 31 (Marks: 1)

In Private ----- only member functions and friend classes or functions of a derived class can convert pointer or reference of derived object to that of parent object

- ▶ specialization
- ▶ **inheritance (Page 216) rep**
- ▶ abstraction
- ▶ composition

Question No: 32 (Marks: 1)

Which of the following is the best approach if it is required to have more than one functions having exactly same functionality and implemented on different data types?

- ▶ **Templates (Page 256) rep**
- ▶ Overloading
- ▶ Data hiding
- ▶ Encapsulation

FINAL TERM EXAMINATION
Spring 2010
CS304- Object Oriented Programming

Question No: 1 (Marks: 1) - Please choose one

A template argument is preceded by the keyword _____.

- ▶ vector
- ▶ **class (Object-Oriented Programming in C++)**
- ▶ template
- ▶ type*

Question No: 2 (Marks: 1) - Please choose one

Which of the following causes run time binding?

- ▶ Declaring object of abstract class
- ▶ Declaring pointer of abstract class
- ▶ **Declaring overridden methods as non-virtual (Page 226)**
- ▶ None of the given

Question No: 3 (Marks: 1) - Please choose one

A function template can not be overloaded by another function template.

- ▶ **True (Object-Oriented Programming in C++)**
- ▶ False

Question No: 4 (Marks: 1) - Please choose one

Which of the following is the best approach if it is required to have more than one functions having exactly same functionality and implemented on different data types?

- ▶ **Templates (Page 256) rep**
- ▶ Overloading
- ▶ Data hiding
- ▶ Encapsulation

Question No: 5 (Marks: 1) - Please choose one

Identify the correct way of declaring an object of user defined template class A for char type members?

- ▶ **A< char > obj; (Object-Oriented Programming in C++)**
- ▶ <char>A obj;
- ▶ A obj<char>;
- ▶ Obj <char> A;

Question No: 6 (Marks: 1) - Please choose one

The user must define the operation of the copy constructor.

- ▶ **True** [Click here for detail](#)
- ▶ False

Question No: 7 (Marks: 1) - Please choose one

Template functions use _____ than ordinary functions.

- ▶ Greater Memory
- ▶ **Lesser Memory**
- ▶ Equal Memory
- ▶ None of the given options

Question No: 8 (Marks: 1) - Please choose one

The find() algorithm

- ▶ finds matching sequences of elements in two containers.
- ▶ finds a container that matches a specified container.
- ▶ **takes iterators as its first two arguments. (Object-Oriented Programming in C++)**
- ▶ takes container elements as its first two arguments.

Question No: 9 (Marks: 1) - Please choose one

Compiler performs _____ type checking to diagnose type errors,

- ▶ **Static (Page 261)**
- ▶ Dynamic
- ▶ Bound
- ▶ Unbound

Question No: 10 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

- ▶ Reusability
- ▶ Writability
- ▶ Maintainability
- ▶ **All of given (Page 256) rep**

Question No: 11 (Marks: 1) - Please choose one

Vectors contain contiguous elements stored as a[an] ____.

- ▶ variable
- ▶ **array (Page 306)**
- ▶ function
- ▶ datatype

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

Question No: 12 (Marks: 1) - Please choose one

Suppose you create an uninitialized vector as follows:

```
vector<int> evec;
```

After adding the statment,

```
evec.push_back(21);
```

what will happen?

- ▶ The following statement will add an element to the start (the back) of evec and will initialize it with the value 21.
- ▶ The following statement will add an element to the center of evec and will reinitialize it with the value 21.
- ▶ The following statement will delete an element to the end (the back) of evec and will reinitialize it with the value 21.
- ▶ **The following statement will add an element to the end (the back) of evec and initialize it with the value 21. [Click here for detail](#)**

Question No: 13 (Marks: 1) - Please choose one

In a de-queue, (chose the best option)

- ▶ data can be quickly inserted or deleted at any arbitrary location.
 - ▶ **data can be inserted or deleted at any arbitrary location, but the process is relatively slow.**
- (Object-Oriented Programming in C++)**
- ▶ data can not be quickly inserted or deleted at either end.
 - ▶ data can be inserted or deleted at either end, but the process is relatively slow.

Question No: 14 (Marks: 1) - Please choose one

Algorithms can only be implemented using STL containers.

- ▶ True
- ▶ **False (Object-Oriented Programming in C++)**

Question No: 15 (Marks: 1) - Please choose one

What is a class?

- ▶ A class is a section of computer memory containing objects.
- ▶ A class is a section of the hard disk reserved for object oriented programs
- ▶ A class is the part of an object that contains the variables.
- ▶ **A class is a description of a kind of object. [Click here for detail](#)**

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

Question No: 16 (Marks: 1) - Please choose one
Inheritance is a way to

- ▶ organize data.
- ▶ pass arguments to objects of classes.
- ▶ **add features to existing classes without rewriting them. (Page 27)**
- ▶ improve data-hiding and encapsulation.

Question No: 17 (Marks: 1) - Please choose one

We can use "this" pointer in the constructor in the body and even in the initialization list of any class if we are careful,

- ▶ **True** [Click here for detail](#)
- ▶ False

Question No: 18 (Marks: 1) - Please choose one

_____ and _____ methods may not be declared abstract.

- ▶ **private,static** [Click here for detail](#)
- ▶ private,public
- ▶ static,public
- ▶ none of given

Question No: 19 (Marks: 1) - Please choose one

Default constructor is such constructor which either has no -----or if it has some parameters these have ----- values

- ▶ Parameter, temporary
- ▶ Null, Parameter
- ▶ **Parameter, default** (Page 75) rep
- ▶ non of the given

Question No: 20 (Marks: 1) - Please choose one

Public methods of base class can ----- be accessed in its derived class

- ▶ **directly** (Page 179)
- ▶ inderectly
- ▶ simultaneously
- ▶ non of the given

Question No: 21 (Marks: 1) - Please choose one

The type that is used to declare a reference or pointer is called its -----

- ▶ default type
- ▶ **static type** (Page 185)
- ▶ abstract type
- ▶ reference type

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

Question No: 22 (Marks: 1) - Please choose one

----- members are somewhere between public and private members. They are used in inheritance

- ▶ **protected (Page 187)**
- ▶ public
- ▶ private
- ▶ global

Question No: 23 (Marks: 1) - Please choose one

Which of these are examples of error handling techniques?

- ▶ Abnormal Termination
- ▶ Graceful Termination
- ▶ Return the illegal
- ▶ **all of the given (Page 329)**

Question No: 24 (Marks: 1) - Please choose one

----- follow try block to catch the object thrown

- ▶ **catch block (Page 333)**
- ▶ throw block
- ▶ main block
- ▶ non of the given

Question No: 25 (Marks: 1) - Please choose one

Graphical representation of the classes and objects is called object model it shows -----

- ▶ Class Name only
- ▶ Class Name and attributes
- ▶ Relationships of the objects and classes
- ▶ **all of the given [Click here for detail](#)**

Question No: 26 (Marks: 1) - Please choose one

Destructor can be overloaded

- ▶ True
- ▶ **False (Page 92)**

Question No: 3 (Marks: 1) - Please choose one

Which of the following is the best approach if it is required to have more than one functions having exactly same functionality and implemented on different data types?

- ▶ **Templates (Page 256) rep**
- ▶ Overloading
- ▶ Data hiding
- ▶ Encapsulation

Question No: 4 (Marks: 1) - Please choose one

Which of the following is the best approach to implement generic algorithms with minimum number of coding lines?

- ▶ **Templates (Page 256)**
- ▶ Overloading
- ▶ Overriding
- ▶ Friend function/class

Question No: 5 (Marks: 1) - Please choose one

Like template functions, a class template may not handle all the types successfully.

- ▶ **True (Page 258) rep**
- ▶ False

Question No: 6 (Marks: 1) - Please choose one

A class template may inherit from another class template.

- ▶ **True (Page 288) rep**
- ▶ False

Question No: 7 (Marks: 1) - Please choose one

Assume a class Derv that is privately derived from class Base. An object of class Derv located in main() can access

- ▶ **public members of Derv. (Object-Oriented Programming in C++) rep**
- ▶ protected members of Derv.
- ▶ private members of Derv.
- ▶ protected members of Base.

Question No: 8 (Marks: 1) - Please choose one

A copy constructor is invoked when

- ▶ a function do not returns by value.
- ▶ **an argument is passed by value. (Page 78) rep**
- ▶ a function returns by reference.
- ▶ an argument is passed by reference.

Question No: 9 (Marks: 1) - Please choose one

Each try block can have _____ no. of catch blocks.

- ▶ 1
- ▶ 2
- ▶ 3
- ▶ **As many as necessary. [Click here for detail](#)**

A single try block can have multiple catch blocks but only one finally block.

Question No: 10 (Marks: 1) - Please choose one

class DocElement

```
{
public:
    virtual void Print() { cout << "Generic element"; }
};
class Heading : public DocElement
{
public:
    void Print() { cout << "Heading element"; }
};
class Paragraph : public DocElement
{
public:
    void Print() { cout << "Paragraph element"; }
};
void main()
{
    DocElement * p = new Paragraph();
```

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

```
p->Print();  
}
```

When you run this program, it will print out a single line to the console output.

What will be in that line?

Select one correct answer from the following list:

- ▶ Generic element
- ▶ Heading element
- ▶ Paragraph element
- ▶ **Nothing will be printed.**

Question No: 11 (Marks: 1) - Please choose one

Suppose we have two derived classes from a single class, can we write a method with same name in both these derived classes? Choose the best option.

- ▶ No
- ▶ **Only if the two classes have the same name (Page 204)**
- ▶ Only if the main program does not declare both kinds
- ▶ Yes

Question No: 12 (Marks: 1) - Please choose one

When a virtual function is called by referencing a specific object by name and using the dot member selection operator (e.g., squareObject.draw()), the reference is resolved at compile time.

- ▶ True
- ▶ **False (Object-Oriented Programming in C++)**
(the function invocation is resolved at compile time)

Question No: 13 (Marks: 1) - Please choose one

Considering the resolution order in which Considering the resolution order in which compiler search for functions in a program; the first priority is given to; the first priority is given to,

- ▶ general template
- ▶ partial specialization
- ▶ complete specialization
- ▶ **ordinary function (Page 287)**

Question No: 14 (Marks: 1) - Please choose one

Vectors contain contiguous elements stored as a[an] ____.

- ▶ variable
- ▶ **array (Page 306) rep**
- ▶ function
- ▶ datatype

Question No: 15 (Marks: 1) - Please choose one

By default the vector data items are initialized to _____

- ▶ 0 [Click here for detail](#) rep
- ▶ 0.0
- ▶ 1
- ▶ null

Question No: 16 (Marks: 1) - Please choose one

One purpose of an iterator in the STL is to connect algorithms and containers.

- ▶ True (Object-Oriented Programming in C++)
- ▶ False

Question No: 17 (Marks: 1) - Please choose one

Algorithms can only be implemented using STL containers.

- ▶ True
- ▶ False (Object-Oriented Programming in C++) rep

Question No: 18 (Marks: 1) - Please choose one

In _____, a base class can be replaced by its derived class,

- ▶ Sub-typing (Page 31)
- ▶ Super-typing
- ▶ Multiple-typing
- ▶ Restricted-typing

Question No: 19 (Marks: 1) - Please choose one

this pointer does not point to current object of any class,

- ▶ True
- ▶ False [Click here for detail](#)

The **this pointer** is a hidden pointer inside every class member function that points to the class object the member function is working with.

Question No: 20 (Marks: 1) - Please choose one

Which of the following operator(s) take(s) one or no argument if overloaded?

- ▶ ++ (Page 162)
- ▶ -
- ▶ +
- ▶ All of the given

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari

Question No: 21 (Marks: 1) - Please choose one

Which of the following operators can not be overloaded?

- ▶ **Scope resolution operator (::) (Page 141)**
- ▶ Insertion operator (<<)
- ▶ Extraction operator (>>)
- ▶ The relation operator (>)

Question No: 22 (Marks: 1) - Please choose one

The type that is used to declare a reference or pointer is called its -----

- ▶ default type
- ▶ **static type (Page 185) rep**
- ▶ abstract type
- ▶ reference type

Question No: 23 (Marks: 1) - Please choose one

----- members are somewhere between public and private members. They are used in inheritance

- ▶ **protected (Page 187) rep**
- ▶ public
- ▶ private
- ▶ global

Question No: 24 (Marks: 1) - Please choose one

Which of these are examples of error handling techniques ?

- ▶ Abnormal Termination
- ▶ Graceful Termination
- ▶ Return the illegal
- ▶ **all of the given (Page 329)**

Question No: 25 (Marks: 1) - Please choose one

_____ “is a” relationship

- ▶ **Inheritance (Page 25)**
- ▶ Polymorphism
- ▶ abstraction
- ▶ encapsulation

Question No: 26 (Marks: 1) - Please choose one

Graphical representation of the classes and objects is called object model it shows -----

- ▶ Class Name only
- ▶ Class Name and attributes
- ▶ Relationships of the objects and classes
- ▶ **all of the given [Click here for detail](#) rep**

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

FINALTERM EXAMINATION
Spring 2010
CS304- Object Oriented Programming (Session - 4)

Question No: 1 (Marks: 1) - Please choose one

Classes like TwoDimensionalShape and ThreeDimensionalShape would normally be concrete, while classes like Sphere and Cube would normally be abstract.

- ▶ **True** [Click here for detail](#) rep
- ▶ False

Question No: 2 (Marks: 1) - Please choose one

Virtual functions allow you to

- ▶ create an array of type pointer-to-base class that can hold pointers to derived classes.
- ▶ create functions that can never be accessed.
- ▶ group objects of different classes so they can all be accessed by the same function code.
- ▶ **use the same function call to execute member functions of objects from different classes (Object-Oriented Programming in C++)**

Question No: 3 (Marks: 1) - Please choose one

- ▶ **True** [Click here for detail](#) rep
- ▶ False

Question No: 4 (Marks: 1) - Please choose one

A copy constructor is invoked when

- ▶ a function do not returns by value.
- ▶ **an argument is passed by value. (Page 78) rep**
- ▶ a function returns by reference.
- ▶ an argument is passed by reference.

Question No: 5 (Marks: 1) - Please choose one

Each try block can have _____ no. of catch blocks.

- ▶ 1
- ▶ 2
- ▶ 3
- ▶ **As many as necessary.** [Click here for detail](#) rep

Question No: 6 (Marks: 1) - Please choose one

Non Template Friend functions of a class are friends of _____ instance/s of

- ▶ **All** [Click here for detail](#) rep
- ▶ One specific
- ▶ All instances of one date type
- ▶ None of the given options

Question No: 7 (Marks: 1) - Please choose one

Template functions use _____ than ordinary functions.

- ▶ Greater Memory
- ▶ **Lesser Memory**
- ▶ Equal Memory
- ▶ None of the given options

Question No: 8 (Marks: 1) - Please choose one

The find() algorithm

- ▶ finds matching sequences of elements in two containers.
- ▶ finds a container that matches a specified container.
- ▶ **takes iterators as its first two arguments. (Object-Oriented Programming in C++)**
- ▶ takes container elements as its first two arguments.

Question No: 9 (Marks: 1) - Please choose one

The copy() algorithm returns an iterator to

- ▶ the last element copied from.
- ▶ the last element copied to.
- ▶ the element one past the last element copied from.
- ▶ **the element one past the last element copied to. (Object-Oriented Programming in C++)**

Question No: 10 (Marks: 1) - Please choose one

If you define a vector v with the default constructor, and define another vector w with a one-argument constructor to a size of 11, and insert 3 elements into each of these vectors with push_back(), then the size() member function will return _____ for v and _____ for w.

- ▶ 11 for v and 3 for w.
- ▶ 0 for v and 0 for w.
- ▶ 0 for v and 3 for w.
- ▶ **3 for v and 11 for w. (Object-Oriented Programming in C++)**

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

Question No: 11 (Marks: 1) - Please choose one

Which is not the Advantage of inheritance?

- ▶ providing class growth through natural selection. (Object-Oriented Programming in C++)
- ▶ facilitating class libraries.
- ▶ avoiding the rewriting of code.
- ▶ providing a useful conceptual framework.

Question No: 12 (Marks: 1) - Please choose one

class DocElement

```
{
public:
    virtual void Print() { cout << "Generic element"; }
};
class Heading : public DocElement
{
public:
    void Print() { cout << "Heading element"; }
};
class Paragraph : public DocElement
{
public:
    void Print() { cout << "Paragraph element"; }
};
void main()
{
    DocElement * p = new Paragraph();

    p->Print();
}
```

When you run this program, it will print out a single line to the console output.

What will be in that line?

Select one correct answer from the following list:

- ▶ Generic element
- ▶ Heading element
- ▶ Paragraph element
- ▶ **Nothing will be printed.**

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

Question No: 13 (Marks: 1) - Please choose one

Which type of inheritance is being represented by the following statement,
class X : public A, public B { };

- ▶ Single inheritance
- ▶ **Multiple inheritance (Page 41)**
- ▶ Double inheritance
- ▶ None of the given options

Question No: 14 (Marks: 1) - Please choose one

When we write a class template the first line must be:

- ▶ template < class *class_name*>
- ▶ template < class *data_type*>
- ▶ **template < class T > (Page 257)**

Here T can be replaced with any name but it is preferable.

- ▶ class class-name()
- class template<*class_name*>

Question No: 15 (Marks: 1) - Please choose one

Function templates should be used where code and behavior must be identical.

- ▶ **True (Page 262)**
- ▶ False

Question No: 16 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

- ▶ Reusability
- ▶ Writability
- ▶ Maintainability
- ▶ **All of given (Page 256) rep**

Question No: 17 (Marks: 1) - Please choose one

The specialization pattern <T*> after the name says that this specialization is to be used for every,

- ▶ data type
- ▶ meta type
- ▶ virtual type
- ▶ **pointer type (Page 286)**

Question No: 18 (Marks: 1) - Please choose one

A range is often supplied to an algorithm by two _____ values.

- ▶ italic
- ▶ **iteration (Object-Oriented Programming in C++)**
- ▶ iterator
- ▶ None of given

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

Question No: 19 (Marks: 1) - Please choose one

Which of the following is an integral part of an object?

- ▶ State
- ▶ Behavior
- ▶ Unique identity
- ▶ **All of the given (Page 12)**

Question No: 20 (Marks: 1) - Please choose one

Consider the following statement

Cupboard has books

What is the relationship between Cupboard and books?

- ▶ Composition
- ▶ **Aggregation**
- ▶ Inheritance
- ▶ None of the given options

Question No: 21 (Marks: 1) - Please choose one

Which sentence clearly defines an object?

- ▶ **one instance of a class. (Page 23)**
- ▶ another word for a class.
- ▶ a class with static methods.
- ▶ a method that accesses class attributes.

Question No: 22 (Marks: 1) - Please choose one

_____, which means if A declares B as its friend it does NOT mean that A can access private data of B. It only means that B can access all data of A.

- ▶ **Friendship is one way only [Click here for detail](#)**
- ▶ Friendship is two way only
- ▶ NO Friendship between classes
- ▶ Any kind of friendship

Question No: 23 (Marks: 1) - Please choose one

The statement `objA=objB;` will cause a compiler error if the objects are of different classes.

- ▶ True
- ▶ **False (Object-Oriented Programming in C++)**

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

Question No: 24 (Marks: 1) - Please choose one

Consider the call given below of an overloaded operator "+",
Rational_number_1 + Rational_number_2

Where Rational_number_1 and Rational_number_2 are the two objects of Rational_number class (a user defined class). Identify which of the above two objects will be passed as an argument to the overloaded operator function?

- ▶ Rational_number_1
- ▶ Rational_number_2
- ▶ Both Rational_number_1 & Rational_number_2
- ▶ **any of the two objects, randomly**

Question No: 25 (Marks: 1) - Please choose one

If a class D has been derived using protected inheritance from class B (If B is a protected base and D is derived class) then public and protected members of B ----- accessed by member functions and friends of class D and classes derived from D

- ▶ **can be** [Click here for detail](#)
- ▶ cannot be
- ▶ does restrict to be
- ▶ not given

Question No: 26 (Marks: 1) - Please choose one

In Private ----- only member functions and friend classes or functions of a derived class can convert pointer or reference of derived object to that of parent object

- ▶ specialization
- ▶ **inheritance** (Page 216) rep
- ▶ abstraction
- ▶ composition

FINAL TERM EXAMINATION SPRING 2010

Question No: 1 (Marks: 1) - Please choose one

Classes like TwoDimensionalShape and ThreeDimensionalShape would normally be concrete, while classes like Sphere and Cube would normally be abstract.

- ▶ **True** [Click here for detail](#) rep
- ▶ **False**

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

Question No: 2 (Marks: 1) - Please choose one

Each try block can have _____ no. of catch blocks.

- ▶ 1
- ▶ 2
- ▶ 3
- ▶ **As many as necessary.** [Click here detail](#)

Question No: 3 (Marks: 1) - Please choose one

Function templates should be used where code and behavior must be identical.

- ▶ **True** (Page 262)
- ▶ False

Question No: 4 (Marks: 1) - Please choose one

Consider the following statement

Cupboard has books

What is the relationship between Cupboard and books?

- ▶ Composition
- ▶ **Aggregation**
- ▶ Inheritance
- ▶ None of the given options

Question No: 5 (Marks: 1) - Please choose one

Identify the correct way of declaring an object of user defined template class **A** for char type members?

- ▶ **A< char > obj;** (Object-Oriented Programming in C++)
- ▶ <char>A obj;
- ▶ A obj<char>;
- ▶ Obj <char> A;

Question No: 6 (Marks: 1) - Please choose one

The user must define the operation of the copy constructor.

- ▶ **True** [Click here for detail](#)
- ▶ False

Question No: 7 (Marks: 1) - Please choose one

Default constructor is such constructor which either has no -----or if it has some parameters these have ----- values

- ▶ Parameter, temporary
- ▶ Null, Parameter
- ▶ **Parameter, default** (Page 75) rep
- ▶ non of the given

Question No: 8 (Marks: 1) - Please choose one

The type that is used to declare a reference or pointer is called its -----

- ▶ default type
- ▶ **static type** (Page 185)
- ▶ abstract type
- ▶ reference type

Question No: 9 (Marks: 1) - Please choose one

How the information hidden within an object can be accessed?

- ▶ Through its interface
- ▶ Through its private data members
- ▶ **Through its private member functions**
- ▶ Through both public and private members

Question No: 10 (Marks: 1) - Please choose one

The sub-object's life is not dependant on the life of master class in _____.

- ▶ Separation
- ▶ Composition
- ▶ **Aggregation (Page 134)**
- ▶ None of the given

Question No: 11 (Marks: 1) - Please choose one

Encapsulation means

Select correct option:

- ▶ Extending the behaviour of class in another class
- ▶ **Data and behaviour are tightly coupled within an entity (Page 16)**
- ▶ One entity takes all the attributes and operations of the other
- ▶ Taking out the common features and put those in a separate class

Question No: 12 (Marks: 1) - Please choose one

Algorithms can only be implemented using STL containers.

- ▶ True
- ▶ **False (Object-Oriented Programming in C++) rep**

Question No: 13 (Marks: 1) - Please choose one

When we write a class template the first line must be:

- ▶ `template < class class_name>`
- ▶ `template < class data_type>`
- ▶ **`template < class T >` (Page 257) rep**
Here T can be replaced with any name but it is preferable.
- ▶ `class class-name()`
`class template<class_name>`

Question No: 14 (Marks: 1) - Please choose one

An STL container can not be used to,

- ▶ **hold objects of class employee.**
- ▶ store elements in a way that makes them quickly accessible.
- ▶ **compile c++ programs. (Object-Oriented Programming in C++)**
- ▶ organize the way objects are stored in memory

Question No: 15 (Marks: 1) - Please choose one

_____, which means if A declares B as its friend it does NOT mean that A can access private data of B. It only means that B can access all data of A.

- ▶ **Friendship is one way only** [Click here for detail](#)
- ▶ Friendship is two way only
- ▶ NO Friendship between classes
- ▶ Any kind of friendship

Question No: 16 (Marks: 1) - Please choose one

Which of the following may not be an integral part of an object?

- ▶ State
- ▶ Behavior
- ▶ **Protected data members (Page 12)**
- ▶ All of given

Question No: 17 (Marks: 1) - Please choose one

Public methods of base class can ----- be accessed in its derived class

- ▶ **directly (Page 179) rep**
- ▶ indirectly
- ▶ simultaneously
- ▶ non of the given

Question No: 18 (Marks: 1) - Please choose one

If a class D has been derived using protected inheritance from class B (If B is a protected base and D is derived class) then public and protected members of B ----- accessed by member functions and friends of class D and classes derived from D

- ▶ **can be** [Click here for detail](#)
- ▶ cannot be
- ▶ does restrict to be
- ▶ not given

Question No: 19 (Marks: 1) - Please choose one

What is true about function templates?

- ▶ The compiler generates only one copy of the function template
- ▶ **The compiler generates a copy of function respective to each type of data (Page 256)**
- ▶ The compiler can only generate copy for the int type data
- ▶ None of the given.

Question No: 20 (Marks: 1) - Please choose one

Which of the following is an integral part of an object?

- ▶ State
- ▶ Behavior
- ▶ Unique identity
- ▶ **All of the given (Page 12) rep**

Question No: 21 (Marks: 1) - Please choose one

When the base class and the derived class have a member function with the same name, you must be more specific which function you want to call (using _____).

- ▶ scope resolution operator
- ▶ dot operator
- ▶ null operator
- ▶ **Operator overloading** [Click here for detail](#)

FINALTERM EXAMINATION

Fall 2009

CS304- Object Oriented Programming (Session - 4)

Question No: 1 (Marks: 1) - Please choose one

A template provides a convenient way to make a family of

- ▶ variables and data members
- ▶ **functions and classes** **(Object-Oriented Programming in C++)**
- ▶ classes and exceptions
- ▶ programs and algorithms

Question No: 2 (Marks: 1) - Please choose one

Which one of the following terms must relate to **polymorphism**?

- ▶ Static allocation
- ▶ Static typing
- ▶ **Dynamic binding** **(Page 239) rep**
- ▶ Dynamic allocation

Question No: 3 (Marks: 1) - Please choose one

What is true about function templates?

- ▶ The compiler generates only one copy of the function template
- ▶ **The compiler generates a copy of function respective to each type of data (Page 256) rep**
- ▶ The compiler can only generate copy for the int type data
- ▶ None of the given.

Question No: 4 (Marks: 1) - Please choose one

Which of the following is the best approach if it is required to have more than one functions having exactly same functionality and implemented on different data types?

- ▶ **Templates** **(Page 256) rep**
- ▶ Overloading
- ▶ Data hiding
- ▶ Encapsulation

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

Question No: 5 (Marks: 1) - Please choose one

```
template <>
class Vector<char*> { }
```

This is an example of partial specialization.

- ▶ **True** (Page 287)
- ▶ False

Question No: 6 (Marks: 1) - Please choose one

Classes like TwoDimensionalShape and ThreeDimensionalShape would normally be concrete, while classes like Sphere and Cube would normally be abstract.

- ▶ **True** [Click here for detail](#) rep
- ▶ False

Question No: 7 (Marks: 1) - Please choose one

A non-virtual member function is defined in a base class and overridden in a derived class; if that function is called through a base-class pointer to a derived class object, the derived-class version is used.

- ▶ True
- ▶ False

Question No: 8 (Marks: 1) - Please choose one

Assume a class Derv that is privately derived from class Base. An object of class Derv located in main() can access

- ▶ **public members of Derv.** (Object-Oriented Programming in C++) rep
- ▶ protected members of Derv.
- ▶ private members of Derv.
- ▶ protected members of Base.

Question No: 9 (Marks: 1) - Please choose one

In order to define a class template, the first line of definition must be:

- ▶ **template <typename T>** (Page 257) rep
- ▶ typename <template T>
- ▶ Template Class <ClassName>
- ▶ Class <Template T>

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

Question No: 10 (Marks: 1) - Please choose one

If there is a pointer p to objects of a base class, and it contains the address of an object of a derived class, and both classes contain a nonvirtual member function, ding(), then the statement p->ding(); will cause the version of ding() in the _____ class to be executed.

- ▶ **Base (Object-Oriented Programming in C++)**
- ▶ Derived
- ▶ Abstract
- ▶ virtual

Question No: 11 (Marks: 1) - Please choose one

When the base class and the derived class have a member function with the same name, you must be more specific which function you want to call (using _____).

- ▶ scope resolution operator
- ▶ dot operator
- ▶ null operator
- ▶ **Operator overloading** [Click here for detail](#)

Question No: 12 (Marks: 1) - Please choose one

Non Template Friend functions of a class are friends of _____instance/s of that class.

- ▶ **All** [Click here for detail](#)
- ▶ One specific
- ▶ All instances of one date type
- ▶ None of the given options

Question No: 13 (Marks: 1) - Please choose one

The find() algorithm

- ▶ finds matching sequences of elements in two containers.
- ▶ finds a container that matches a specified container.
- ▶ **takes iterators as its first two arguments. (Object-Oriented Programming in C++) rep**
- ▶ takes container elements as its first two arguments.

Question No: 14 (Marks: 1) - Please choose one

If you define a vector v with the default constructor, and define another vector w with a one-argument constructor to a size of 11, and insert 3 elements into each of these vectors with push_back(), then the size() member function will return _____ for v and _____ for w.

- ▶ 11 for v and 3 for w.
- ▶ 0 for v and 0 for w.
- ▶ 0 for v and 3 for w.
- ▶ **3 for v and 11 for w. (Object-Oriented Programming in C++) rep**

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

Question No: 15 (Marks: 1) - Please choose one

Which of the following may not be an integral part of an object?

- ▶ State
- ▶ Behavior
- ▶ **Protected data members (Page 12)**
- ▶ All of given

Question No: 16 (Marks: 1) - Please choose one

Which is not the Advantage of inheritance?

- ▶ **providing class growth through natural selection. (Object-Oriented Programming in C++) rep**
- ▶ facilitating class libraries.
- ▶ avoiding the rewriting of code.
- ▶ providing a useful conceptual framework.

Question No: 17 (Marks: 1) - Please choose one

1class DocElement

```
{
public:
    virtual void Print() { cout << "Generic element"; }
};
```

2class Heading : public DocElement

```
{
public:
    void Print() { cout << "Heading element"; }
};
```

3class Paragraph : public DocElement

```
{
public:
    void Print() { cout << "Paragraph element"; }
};
```

void main()

```
{
    DocElement * p = new Paragraph();

    p->Print();
}
```

When you run this program, it will print out a single line to the console output.

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

What will be in that line?

Select one correct answer from the following list:

- ▶ Generic element
- ▶ Heading element
- ▶ Paragraph element
- ▶ **Nothing will be printed.**

Question No: 18 (Marks: 1) - Please choose one

When a virtual function is called by referencing a specific object by name and using the dot member selection operator (e.g., `squareObject.draw()`), the reference is resolved at compile time.

- ▶ True
- ▶ **False (Object-Oriented Programming in C++)**
(the function invocation is resolved at compile time)

Question No: 19 (Marks: 1) - Please choose one

In case of multiple inheritance a derived class inherits,

- ▶ Only the public member functions of its base classes
- ▶ Only the public data members of its base classes
- ▶ **Both public data members and member functions of all its base classes**
[Click here for detail](#)
- ▶ Data members and member functions of any two base classes

Question No: 20 (Marks: 1) - Please choose one

When we write a class template the first line must be:

- ▶ `template < class class_name>`
- ▶ `template < class data_type>`
- ▶ **`template < class T >` (Page 257) rep**

Here T can be replaced with any name but it is preferable.

- ▶ `class class-name()`

`class template<class_name>`

Question No: 21 (Marks: 1) - Please choose one

Which of the following is incorrect line regarding function template?

- ▶ `template<class T>`
- ▶ `template <typename U>`
- ▶ **`Class<template T>` (Page 257)**
- ▶ `template < class T, class U>`

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari

Question No: 22 (Marks: 1) - Please choose one

An STL container can not be used to,

- ▶ hold objects of class employee.
- ▶ store elements in a way that makes them quickly accessible.
- ▶ **compile c++ programs. (Object-Oriented Programming in C++) rep**
- ▶ organize the way objects are stored in memory

Question No: 23 (Marks: 1) - Please choose one

Algorithms can only be implemented using STL containers.

- ▶ True
- ▶ **False (Object-Oriented Programming in C++) rep**

Question No: 24 (Marks: 1) - Please choose one

Consider a class named Vehicle, which of the following can be the instance of class Vehicle?

1. Car
 2. Computer
 3. Desk
 4. Ahmed
 5. Bicycle
 6. Truck
- ▶ 1, 4, 5
 - ▶ 2, 5, 6
 - ▶ 1, 2, 3, 6
 - ▶ **1, 5, 6 (correct)**

Question No: 25 (Marks: 1) - Please choose one

Consider the code below,

```
class Fred {
public:
Fred();
...
};
int main()
{
Fred a[10];
Fred* p = new Fred[10];
...
}
```

Select the best option,

- ▶ Fred a[10]; calls the default constructor 09 times
- ▶ Fred* p = new Fred[10]; calls the default constructor 10 times
- ▶ Produce an error

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

▶ Fred a[10]; calls the default constructor 11 times
Fred* p = new Fred[10]; calls the default constructor 11 times

▶ **Fred a[10]; calls the default constructor 10 times**
Fred* p = new Fred[10]; calls the default constructor 10 times [Click here for detail](#)

Question No: 26 (Marks: 1) - Please choose one

When a variable is define as **static** in a class then all object of this class,

- ▶ Have different copies of this variable
- ▶ **Have same copy of this variable (Page 110)**
- ▶ Can not access this variable
- ▶ None of given

Question No: 27 (Marks: 1) - Please choose one

The life of sub object is dependant on the life of master class in _____.

- ▶ Separation
- ▶ **Composition (Page 53)**
- ▶ Aggregation
- ▶ None of the given

Question No: 28 (Marks: 1) - Please choose one

_____, which means if A declares B as its friend it does NOT mean that A can access private data of B. It only means that B can access all data of A.

- ▶ **Friendship is one way only** [Click here for detail](#)
- ▶ Friendship is two way only
- ▶ NO Friendship between classes
- ▶ Any kind of friendship

Question No: 29 (Marks: 1) - Please choose one

Which of the following operators always takes no argument if overloaded?

- ▶ /
- ▶ -
- ▶ +
- ▶ **++ (Page 162)**

Question No: 30 (Marks: 1) - Please choose one

In Private ----- only member functions and friend classes or functions of a derived class can convert pointer or reference of derived object to that of parent object

- ▶ specialization
- ▶ **inheritance (Page 216) rep**
- ▶ abstraction
- ▶ composition

Muhammad Moaaz Siddiq – MCS (2nd)

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

FINAL TERM EXAMINATION
Fall 2009
CS304- Object Oriented Programming (Session - 1)

Question No: 1 (Marks: 1) - Please choose one

Which one of the following terms must relate to **polymorphism**?

- ▶ Static allocation
- ▶ Static typing
- ▶ **Dynamic binding (Page 239) rep**
- ▶ Dynamic allocation

Question No: 2 (Marks: 1) - Please choose one

Multiple inheritance can be of type

- ▶ Public
- ▶ Private
- ▶ Protected
- ▶ **All of the given [Click here for detail](#)**

Question No: 3 (Marks: 1) - Please choose one

When a subclass specifies an alternative definition for an attribute or method of its superclass, it is _____ the definition in the superclass.

- ▶ overload
- ▶ **overriding (Page 34)**
- ▶ copy riding
- ▶ none of given

Question No: 4 (Marks: 1) - Please choose one

Like template functions, a class template may not handle all the types successfully.

- ▶ **True (Page 258) rep**
- ▶ False

Question No: 5 (Marks: 1) - Please choose one

It is sometimes useful to specify a class from which no objects will ever be created.

- ▶ **True (Object-Oriented Programming in C++)**
- ▶ False

Question No: 6 (Marks: 1) - Please choose one

Assume a class Derv that is privately derived from class Base. An object of class Derv located in main() can access

- ▶ **public members of Derv. (Object-Oriented Programming in C++) rep**
- ▶ protected members of Derv.
- ▶ private members of Derv.
- ▶ protected members of Base.

Question No: 7 (Marks: 1) - Please choose one

A pointer to a base class can point to objects of a derived class.

- ▶ True [Click here for detail](#)
- ▶ False

Question No: 8 (Marks: 1) - Please choose one

A copy constructor is invoked when

- ▶ a function do not returns by value.
- ▶ **an argument is passed by value. (Page 78) rep**
- ▶ a function returns by reference.
- ▶ an argument is passed by reference.

Question No: 9 (Marks: 1) - Please choose one

A function call is resolved at run-time in_____

- ▶ non-virtual member function.
- ▶ **virtual member function. (Page 239) rep**
- ▶ Both non-virtual member and virtual member function.
- ▶ None of given

Question No: 10 (Marks: 1) - Please choose one

When the base class and the derived class have a member function with the same name, you must be more specific which function you want to call (using _____).

- ▶ scope resolution operator
- ▶ dot operator
- ▶ null operator
- ▶ **Operator overloading** [Click here for detail](#)

Question No: 11 (Marks: 1) - Please choose one

Each try block can have _____ no. of catch blocks.

- ▶ 1
- ▶ 2
- ▶ 3
- ▶ **As many as necessary. [Click here for detail](#) rep**

Question No: 12 (Marks: 1) - Please choose one

Two important STL associative containers are _____ and _____.

- ▶ **set,map (Object-Oriented Programming in C++) rep**
- ▶ sequence,mapping
- ▶ setmet,multipule
- ▶ sit,mat

Question No: 13 (Marks: 1) - Please choose one

The mechanism of selecting function at run time according to the nature of calling object is called,

- ▶ late binding
- ▶ static binding
- ▶ virtual binding
- ▶ **None of the given options (Page 227)**

Dynamic binding means that target function for a call is selected at run time

Question No: 14 (Marks: 1) - Please choose one

An abstract class is useful when

- ▶ We do not derive any class from it.
- ▶ There are multiple paths from one derived class to another.
- ▶ **We do not want to instantiate its object. (Object-Oriented Programming in C++) rep**
- ▶ You want to defer the declaration of the class.

Question No: 15 (Marks: 1) - Please choose one

Which of the following is incorrect line regarding function template?

- ▶ `template<class T>`
- ▶ `template <typename U>`
- ▶ **`Class<template T>` (Page 257) rep**
- ▶ `template < class T, class U>`

Question No: 16 (Marks: 1) - Please choose one

Which of the following is/are advantage[s] of generic programming?

- ▶ Reusability
- ▶ Writability
- ▶ Maintainability
- ▶ **All of given (Page 256) rep**

Question No: 17 (Marks: 1) - Please choose one

By default the vector data items are initialized to _____

- ▶ **0 [Click here for detail](#) rep**
- ▶ 0.0
- ▶ 1
- ▶ null

Question No: 18 (Marks: 1) - Please choose one

Which one of the following functions returns the total number of elements in a vector.

- ▶ `length();`
- ▶ **`size(); (Page 318)`**
- ▶ `ele();`
- ▶ `veclen();`

Question No: 19 (Marks: 1) - Please choose one

Suppose you create an uninitialized vector as follows:

```
vector<int> evec;
```

After adding the statement,

```
evec.push_back(21);
```

what will happen?

- ▶ The following statement will add an element to the start (the back) of evec and will initialize it with the value 21.
- ▶ The following statement will add an element to the center of evec and will reinitialize it with the value 21.
- ▶ The following statement will delete an element to the end (the back) of evec and will reinitialize it with the value 21.
- ▶ **The following statement will add an element to the end (the back) of evec and initialize it with the value 21.** [Click here for detail](#)

Question No: 20 (Marks: 1) - Please choose one

An STL container can not be used to,

- ▶ hold objects of class employee.
- ▶ store elements in a way that makes them quickly accessible.
- ▶ **compile c++ programs. (Object-Oriented Programming in C++) rep**
- ▶ organize the way objects are stored in memory

Question No: 21 (Marks: 1) - Please choose one

Algorithms can only be implemented using STL containers.

- ▶ True
- ▶ **False (Object-Oriented Programming in C++) rep**

Question No: 22 (Marks: 1) - Please choose one

The main function of scope resolution operator (::) is,

- ▶ To define an object
- ▶ To define a data member
- ▶ **To link the definition of an identifier to its declaration** [Click here for detail](#)
- ▶ To make a class private

Question No: 23 (Marks: 1) - Please choose one

When is a constructor called?

- ▶ Each time the constructor identifier is used in a program statement
- ▶ **During the instantiation of a new object (Object-Oriented Programming in C++)**
- ▶ During the construction of a new class
- ▶ At the beginning of any program execution

Question No: 24 (Marks: 1) - Please choose one

Consider the code below,

```
class Fred {
public:
Fred();
...
};
int main()
{
Fred a[10];
Fred* p = new Fred[10];
...
}
```

Select the best option,

- ▶ Fred a[10]; calls the default constructor 09 times
- Fred* p = new Fred[10];
 - ▶ Produce an error
 - ▶ Fred a[10]; calls the default constructor 11 times
- Fred* p = new Fred[10]; calls the default constructor 11 times

▶ **Fred a[10]; calls the default constructor 10 times**
▶ **Fred* p = new Fred[10]; calls the default constructor 10 times** [Click here for detail](#)

Question No: 25 (Marks: 1) - Please choose one

Associativity can be changed in operator overloading.

- ▶ True
- ▶ **False (Page 141)**

Question No: 26 (Marks: 1) - Please choose one

A normal C++ operator that acts in special ways on newly defined data types is said to be

- ▶ glorified.
- ▶ encapsulated.
- ▶ classified.
- ▶ **overloaded. (Object-Oriented Programming in C++)**

Question No: 27 (Marks: 1) - Please choose one

Which operator can not be overloaded?

- ▶ The relation operator (>=)
- ▶ Assignment operator (=)
- ▶ Script operator ([])
- ▶ **Conditional operator (? :) (Page 141)**

Muhammad Moaaz Siddiq – MCS (2nd)

mc100401285@Gmail.com

**Campus:- Institute of E-Learning & Modern
Studies (IEMS) Samundari**

Question No: 28 (Marks: 1) - Please choose one

Suppose obj1 and obj2 are two objects of a user defined class A. An + operator is overloaded to add obj1 and obj2 using the function call obj1+obj2.

Identify the correct function prototype against the given call?

- ▶ A operator + (A &obj);
- ▶ **int + operator(); (Page 143)**
- ▶ int operator (plus) ();
- ▶ A operator(A &obj3);

Question No: 29 (Marks: 1) - Please choose one

Default constructor is such constructor which either has no -----or if it has some parameters these have ----- values

- ▶ Parameter, temporary
- ▶ Null, Parameter
- ▶ **Parameter, default (Page 75) rep**
- ▶ non of the given

Question No: 30 (Marks: 1) - Please choose one

Public methods of base class can ----- be accessed in its derived class

- ▶ **directly (Page 179) rep**
- ▶ inderectly
- ▶ simultaneously
- ▶ non of the given

CS304- Object Oriented Programming
Quiz No. 2
Dated January 11, 2012

Quiz#2

Dear CS304 Students,

There will be a Quiz dated on 11th January 2011. Quiz will remain open for 24 hours. Quiz will conduct from lecture # 25-35. So, be prepared accordingly.

Best of luck

A template provides a convenient way to make a family of

Select correct option:

variables and data members

functions and classes

classes and exceptions

programs and algorithms

A class template may inherit from another class template.

Select correct option:

True

False

Target of a _____ function call is determined at run time.

Select correct option:

instance

virtual

operator

none of given

A class hierarchy

Select correct option:

shows the same relationships as an organization chart.

describes "has a" relationships.

describes "is a kind of" relationships.

shows the same relationships as a family tree.

Sender of the message does not need to know the exact class of receiver in_____.

Select correct option:

Abstraction

Polymorphism

Inheritance

none of the given

A function call is resolved at run-time in_____

Select correct option:

non-virtual member function

virtual member function

Both non-virtual member and virtual member function.

None of given

Adding a derived class to a base class requires fundamental changes to the base class.

Select correct option:

True

False

User can make virtual table explicitly.

Select correct option:

True

False

Binding means that target function for a call is selected at compile time.

Select correct option:

Static

Dynamic

Automatic

None of given

Target of a _____ function call is determined at run time.

Select correct option:

instance

virtual

operator

none of given

Which line will produce error. Class phone: private Transmit, private Receiver { } 1. int main() 2. { 3. phone obj; 4. Transmit* obj1 = &obj; 5. Received obj2 = &obj; 6. }

Select correct option:

3rd line will produce error

4th line will produce error

3rd and 4th line will produce error.

5th line will produce error

Function overriding is done in context of,

Select correct option:

Single class

Single derived class

Single base class

Derived and base classes

Consider the code below, class class1{ public: void func1(); }; class class2 : protected class1 { }; Function func1 of class1 is _____ in class2,

Select correct option:

public

protected

private

none of the given options

the following statements: 1) int iArray[5]; 2) int *pArr = iArray;

Select correct option:

These statements will compile successfully

Error in first statement

Error in second statement

None of given options

Methodologies to the development of reusable software relate to_____.

Select correct option:

- Structure programming
- procedural programming
- generic programming**
- None of the given

function template must have a parameter.

Select correct option:

- True
- False**

The default inheritance mode is,

Select correct option:

- Public inheritance
- Protected inheritance
- Private inheritance**
- None of these options

Two functions with same names, parameters and return type can exist in,

Select correct option:

- Function overloading**
- Function overriding
- Operator overloading
- None of these options

Consider the code below, `class c1{ }; class c2 : public c1 { }; class c3 : public c2 { };` Then c2 is,

Select correct option:

- Direct base class of c3**

Direct child class of c3
Direct base class of c1
None of these

Virtual functions allow you to

Select correct option:

create an array of type pointer-to-base class that can hold pointers to derived classes.

create functions that can never be accessed.

group objects of different classes so they can all be accessed by the same function code.

use the same function call to execute member functions of objects from different classes.

User can make virtual table explicitly.

Select correct option:

True

False

In order to define a class template the first line of definition must be:

Select correct option:

template <typename T>

typename <template T>

Template Class <ClassName>

Class <Template T>

Consider the following statements: 1) int iArray[5]; 2) int *pArr = iArray;

Select correct option:

These statements will compile successfully

Error in first statement

Error in second statement

None of given options

In c++ dynamic binding and polymorphism will be achieved when member function will be ___.

Select correct option:

private

public

virtual

inline

In type in depended function template should be use where code and behavior must be identical.

Select correct option:

True

False

Consider the code below, class class1{ protected: int i; }; class class2 : private class1 { }; Then int member i of class1 is _____ in class2,

Select correct option:

public

protected

private

none of the given options

In specialization we can,

Select correct option:

Replace child class with its base class

Replace base class with its child class (Not Sure)

Replace both child and base classes interchangeably

None of the given options

Consider the code below, class class1{ public: void func1(); }; class class2 : public class1 { }; Function func1 of class1 is _____ in class2,

Select correct option:

public

protected

private

none of the given options

It is illegal to make objects of one class members of another class.

Select correct option:

True

False

An abstract class is useful when

Select correct option:

no classes should be derived from it.

there are multiple paths from one derived class to another.

no objects should be instantiated from its.

you want to defer the declaration of the class.

In resolution order compiler search firstly _____.

Select correct option:

Generic Template

Partial Specialization

Complete Specialization

Ordinary function

```
template<> class Vector{ void** p; //.... void*& operator[] ((int i); };
```

Select correct option:

This specialization can then be used as the common implementation for all Vectors of pointers.

This specialization can then be used as the all type implementation for one type classes.

This specialization can then be used double type pointers.

This specialization should be used for Vectors of all type int types.

In private inheritance derived class pointer can be assigned to base class pointer in,

Select correct option:

Main function

In derived class member and friend functions

In base class member and friend functions

None of the given options

Which statement will be true for concrete class?

it implements an virtual concept.

it can be instantiated

it cannot be instantiated

none of given

Target of a _____ function call is determined at run time.

Select correct option:

instance

virtual

operator

none of given

The Specialization pattern after the name says that this specialization is to be used for every_____.

Select correct option:

data types

meta types

virtual types

pointers type

c++ dynamic binding and polymorphism will be achieved when member function will be ____.

Select correct option:

private

public
virtual
inline

Consider the code below, class class1{ protected: void func1(); }; class class2 : public class1 { }; Function func1 of class1 is _____ in class2,
Select correct option:

public
protected
private
none of the given options

Consider the code below, class class1{ protected: int i; }; class class2 : protected class1 { }; Then int member i of class1 is _____ in class2,
Select correct option:

public
protected
private
none of the given options

Consider the code below, class class1{ private: void func1(); }; class class2 : private class1 { }; Function func1 of class1 is _____ in class2,
Select correct option:

public
protected
private
none of the given options

Target of a _____ function call is determined at run time.

Select correct option:

instance
virtual
operator
none of given

Consider the following statements: 1) int iArray[5]; 2) int *pArr = iArray;
Select correct option:

These statements will compile successfully

Error in first statement

Error in second statement

None of given options

Consider the code below, class class1{ private: int i; }; class class2 : private class1 { }; Then int member i of class1 is ____ in class2,

Select correct option:

public

protected

private

none of the given options

If there is a pointer, p, to objects of a base class, and it contains the address of an object of a derived class, and both classes contain a virtual member function, ding(), then the statement p->ding(); will cause the version of ding() in the ____ class to be executed.

Select correct option:

base

derived

virtual

implemented

A class template may inherit from another class template.

Select correct option:

True

False

Derived class can inherit from public base class as well as private and protected base classes

Select correct option:

True

False

Two functions with same names, parameters and return type can exist in,

Select correct option:

Function overloading

Function overriding
Operator overloading
None of these options

Consider the code below, class class1{ private: int i; }; class class2 : public class1 { }; Then int member i of class1 is _____ in class2,
Select correct option:

public
protected
private
none of the given options

Target of a _____ function call is determined at run time.
Select correct option:

instance
virtual
operator
none of given

A class template may inherit from another class template.
Select correct option:

True
False

A function call is resolved at run-time in _____
Select correct option:

non-virtual member function
virtual member function
Both non-virtual member and virtual member function.
None of given
hello

A class hierarchy

Select correct option:

shows the same relationships as an organization chart.

describes "has a" relationships.

describes "is a kind of" relationships.

shows the same relationships as a family tree.

Consider the code below, `class class1{ public: int i; }; class class2 : public class1 { };` Then int member i of class1 is _____ in class2,

Select correct option:

public

protected

private

none of the given options

Consider the code below, `class c1{ }; class c2 : public c1 { }; class c3 : public c2 { };` Then c1 is,

Select correct option:

Direct base class of c3

Direct child class of c3

Direct base class of c2

Direct child class of c2

A class can inherit from more than one class is called.

Select correct option:

Simple inheritance

Multiple inheritances

Single inheritance

Double inheritance

```
template<> class Vector{ void** p; //.... void*& operator[] ((int i); );
```

Select correct option:

This specialization can then be used as the common implementation for all Vectors of pointers.

This specialization can then be used as the all type implementation for one type classes.

This specialization can then be used double type pointers.

This specialization should be used for Vectors of all type int types.

Consider the code below, class class1{ public: int i; }; class class2 : protected class1 { }; Then int member i of class1 is _____ in class2,

Select correct option:

public

protected

private

none of the given options

Consider the code below, class class1{ private: void func1(); }; class class2 : public class1 { }; Function func1 of class1 is _____ in class2,

Select correct option:

public

protected

private

none of the given options

Templates automatically create different versions of a function, depending on user input.

Select correct option:

True

False

_____ Binding means that target function for a call is selected at run time

Select correct option:

Automatic

Dynamic

Static

Dramatic

When we create objects, then space is allocated to:

Member function

Access specifier

Data member

None of given

There is only one form of copy constructor.

True

False

Which of the following features of OOP is used to deal with only relevant details?

Abstraction

Information hiding

Object

_____ Binding means that targets function for a call is selected at compile time.

Static

Dynamic

Automatic

None of given

A Class hierarchy

Shows the same relationships as an organization chart

Describes "has a" relationships.

Describes "is a kind of" relationships.

Shows the same relationships as a family tree

In C++, we declare a function virtual by preceding the function header with keyword "inline"

True

False

It is illegal to make objects of one class members of another class.

True

False

In Resolution order compiler search firstly_____.

Generic Template

Partial Specification

Complete Specification

Ordinary function

Derived class can inherit from public base class as well as private and protected base classes

True

False

Which line will produce error. Class phone: Private Transmit, private Receiver { } 1.int main () 2. { 3.phone obj; 4.Transmit*obj1 = &obj; 5.Received obj2 = &obj; 6.}

3rd line will produce error

4th line will produce error

3rd and 4th line will produce error.

5th line will produce error.

Methodologies to the development of reusable software relate to

_____.

Structure programming

Procedural programming

Generic programming

None of the given

A template argument is preceded by the keyword_____.

Vector

Class

Template

Type*

Friends are used exactly the same for template and non-template classes.

True

False

A function template must have a parameter

True

False

Child class can call constructor of its,

Direct base class

Indirect base class

Both direct and indirect base classes

None of these.

Which statement will be true for concrete class?

It implements an virtual concept.

It can be instantiated

It cannot be instantiated

None of given

A class D can be derived from a class C, which is derived from a class B, which is derived from a class A

True

False

Adding a derived class to a base class requires fundamental changes to the base class.

True

False

A Class or class template can have member _____ that are themselves templates.

Variable

Function

Objects

None of given

Which will be the Primary task or tasks of generic programming?

Categorize the abstractions in a domain into concepts

Implement generic algorithms based on the concepts

Build concrete models of the concepts

All of given

The default inheritance mode is,

Public inheritance

Protected Inheritance

Private Inheritance

None of these options

If there is a pointer, p, to objects of a base class, and it contains the address of an object of a derived class, and both classes contain a virtual member function, ding(), then the statement p->ding(); will cause the version of ding() in the _____ class to be executed.

Base

Derived

Virtual

Implemented

A class template _____

Facilitates reuse of class

Does not facilitate reuse of class

Sender of the message does not need to know the exact class of receiver in_____.

Abstraction

Polymorphism

Inheritance

none of the given
